Mr. Gerry Carrigan
Executive Director
North Texas Tollway Authority
5900 West Plano Parkway, Suite 100
Plano, TX 75093

Re: North Texas Tollway Authority System Comprehensive Traffic and Toll Revenue Study

Dear Mr. Carrigan:

CDM Smith is pleased to submit this North Texas Tollway Authority System Comprehensive Traffic and Toll Revenue (T&R) Study draft report. The report summarizes the results of the study, which includes T&R estimates for a fifty-year period. The purpose of this study was to conduct a Comprehensive T&R evaluation for all of the current NTTA facilities. The NTTA facilities for which T&R estimates are included in this report are the Dallas North Tollway (DNT), President George Bush Turnpike (PGBT), President George Bush Turnpike Eastern Extension (PGBT EE), Sam Rayburn Tollway (SRT), President George Bush Turnpike Western Extension (PGBT WE), Chisholm Trail Parkway (CTP), Addison Airport Toll Tunnel (AATT), Mountain Creek Lake Bridge (MCLB) and Lewisville Lake Toll Bridge (LLTB).

Our project team, including Michael Copeland, Justin Winn, Yagnesh Jarmarwala, Naveen Mokkapati, Maneesh Mahlawat, Parth Patel, Gustavo Baez (Baez Consulting), Paul Winkelblech (Research and Demographic Solutions), and others, gratefully acknowledge the assistance and cooperation received from NTTA as well as others contacted during the course of the study. CDM Smith sincerely appreciates the opportunity to have participated in this important project.

Respectfully submitted,

Kamran A. Khan
Senior Vice President
CDM Smith Inc.

Disclaimer

Current accepted professional practices and procedures were used in the development of these traffic and revenue estimates. However, as with any forecast of the future, it should be understood that there may be differences between forecasted and actual results caused by events and circumstances beyond the control of the forecasters. In formulating its estimates, CDM Smith has reasonably relied upon the accuracy and completeness of information provided (both written and oral) by North Texas Tollway Authority. CDM Smith also has relied upon the reasonable assurances of some independent parties and is not aware of any facts that would make such information misleading.

CDM Smith has made qualitative judgments related to several key variables in the development and analysis of the traffic and revenue estimates that must be considered as a whole; therefore selecting portions of any individual result without consideration of the intent of the whole may create a misleading or incomplete view of the results and the underlying methodologies used to obtain the results. CDM Smith gives no opinion as to the value or merit of partial information extracted from this report.

All estimates and projections reported herein are based on CDM Smith's experience and judgment and on a review of information obtained from multiple agencies, including North Texas Tollway Authority. These estimates and projections may not be indicative of actual or future values, and are therefore subject to substantial uncertainty. Future developments cannot be predicted with certainty, and may affect the estimates or projections expressed in this report, such that CDM Smith does not specifically guarantee or warrant any estimate or projection contained within this report.

While CDM Smith believes that the projections or other forward-looking statements contained within the report are based on reasonable assumptions as of the date of the report, such forward looking statements involve risks and uncertainties that may cause actual results to differ materially from the results predicted. Therefore, following the date of this report, CDM Smith will take no responsibility or assume any obligation to advise of changes that may affect its assumptions contained within the report, as they pertain to socioeconomic and demographic forecasts, proposed residential or commercial land use development projects and/or potential improvements to the regional transportation network.

CDM Smith is not a financial advisor to the North Texas Tollway Authority, and as such:

- CDM Smith is not recommending any action to the North Texas Tollway Authority (NTTA)
- CDM Smith is not acting as an advisor to NTTA and does not owe a fiduciary duty pursuant to Section 15B of the Exchange Act to NTTA with respect to the information and material contained in this communication
- NTTA should discuss any information and material contained in this communication with any and all internal or external advisors and experts NTTA deems appropriate before acting on the information in the report

Executive Summary

This report documents the methodology, process, and results of a comprehensive traffic and revenue (T&R) study as requested of CDM Smith by the North Texas Tollway Authority (NTTA). The study included a system-wide review, traffic and socioeconomic data collection and analysis, and development of an independent fifty-year T&R forecast for all of NTTA's toll facilities, which includes the following:

- **Dallas North Tollway (DNT)**
  - Limits: IH 35E in Dallas to US 380 in Frisco
  - Length: Approximately 31 miles
- **President George Bush Turnpike (PGBT), Excluding Eastern Extension**
  - Limits: Belt Line Road in Irving to SH 78 in Garland
  - Length: Approximately 30 miles
- **President George Bush Turnpike Eastern Extension (PGBT EE)**
  - Limits: SH 78 in Garland to IH 30 in Garland
  - Length: Approximately 10 miles
- **Sam Rayburn Tollway (SRT)**
  - Limits: Business 121 in Coppell to US 75 in McKinney
  - Length: Approximately 26 miles
- **President George Bush Turnpike Western Extension (PGBT WE)**
  - Limits: IH 20 in Grand Prairie to SH 183 in Irving
  - Length: Approximately 10 miles
- **Chisholm Trail Parkway (CTP)**
  - Limits: US 67 in Cleburne to IH 30 in Fort Worth
  - Length: Approximately 28 miles
- **Addison Airport Toll Tunnel (AATT)**
- **Lewisville Lake Toll Bridge (LLTB)**
- **Mountain Creek Lake Bridge (MCLB)**

This study builds upon previous T&R studies, the most recent of which is the NTTA System Comprehensive Traffic and Toll Revenue Study, prepared by CDM Smith in December 2016 (the "December 2016 Study"). The North Central Texas Council of Governments (NCTCOG) adopted a new metropolitan transportation plan (MTP) in March 2016 called Mobility 2040. The updated travel demand model roadway networks from the new MTP were incorporated into the T&R estimates included in the December 2016 Study, which also included an independent economic review of the

Mobility 2040 demographics along the NTTA corridors as well as comprehensive traffic count and travel time data collection. In addition, observed transaction and revenue trends were incorporated into the analysis.

The December 2016 Study focused solely on the existing NTTA System, which is currently comprised of the DNT, PGBT, PGBT EE, SRT, AATT, MCLB and LLTB. NTTA's other two roadways, PGBT WE and CTP, are currently part of the Special Projects System. It is anticipated that the NTTA System will be expanded to include CTP and PGBT WE following the refunding of the Special Projects System bonds and other debt in the fall of 2017. Therefore, CTP and PGBT WE have been incorporated into this current study, and the T&R forecasts presented in this report will include these two facilities.

Based on traffic forecasts developed for each toll gantry location, annual forecasts for each facility of the NTTA System were prepared through 2066. The projections extend from 2017 through 2066 and include the revenue forecasts for DNT, PGBT, AATT, MCLB, LLTB, PGBT EE, SRT, PGBT WE and CTP. In each case, forecasts for each of the facilities are based on modeled traffic estimates at each toll collection location, through the year 2040. These modeled estimates were refined, using post-model adjustments, reflecting validation factors used to match observed 2017 traffic data at each toll gantry location.

The average toll at each location was based on the current mix of passenger car and commercial vehicle traffic and the current average tolls, modified in future years to reflect changing assumptions in the proportion of AVI and ZipCash transaction shares. Toll rates for ZipCash transactions are 50 percent higher than the rates for AVI transactions (with a minimum differential of $0.25 in 2017 dollars) in each case.

Estimates beyond year 2040 are based on nominal assumptions regarding future traffic growth as, with assumed toll rate increases as noted previously. As shown in Table ES-1, the estimated annual revenue on the DNT is expected to increase from $247.9 million in 2017 to $364.8 million by 2025 and $545.5 million by 2035. Revenue on the PGBT is expected to be $221.0 million in 2017, increasing to $320.6 million by 2025 and $481.7 million by 2035. Revenue on the SRT is expected to be $177.8 million in 2017, increasing to $268.0 million by 2025 and $424.4 million by 2035. As 2058 is the end of the fifty-year operational agreement of the SRT between NTTA and TxDOT, revenue from SRT is estimated through August 31, 2058, while the other facilities are assumed to generate revenue for NTTA in perpetuity. The PGBT EE toll revenue shown is the NTTA's share of the toll revenue. Under the PGBT EE project agreement with TxDOT, NTTA keeps 80 percent of the revenue generated by the PGBT EE, and the remaining 20 percent is paid to TxDOT. NTTA's share of the revenue on the PGBT EE is expected to be $36.9 million in 2017, increasing to $57.0 million by 2025 and $93.2 million by 2035. Together, the DNT, PGBT and SRT account for the majority of revenue generated by the NTTA System.

The estimated annual revenue on PGBT WE is expected to increase from $56.1 million in 2017 to $96.2 million by 2025 and $151.9 million by 2035. Revenue on the CTP is expected to be $44.9 million in 2017, increasing to $82.9 million by 2025 and $149.9 million by 2035. Revenue from the AATT, MCLB and LLTB are expected to be about $10.3 million, combined, in 2017. By 2025 this is estimated to reach a combined $15.5 million, still a very small share of total NTTA System revenue.

Total revenue on the existing NTTA System, is expected to increase from about $795.0 million in 2017 to $1.20 billion in 2025 and $1.87 billion in 2035. Driven by nominal traffic growth and continued assumed modest inflationary adjustments in toll rates, revenue on the NTTA System is expected to reach more than $3 billion per year by 2047.

Table ES-1. NTTA System Estimated Annual Toll Revenue (millions)

Year	DNT	PGBT	SRT	PGBT EE*	PGBT WE	CTP	AATT-MCLB-LLTB	NTTA System
2017	$247.89	$221.02	$177.85	$36.91	$56.12	$44.94	$10.31	$795.03
2018	$263.37	$230.88	$189.03	$38.75	$59.03	$50.99	$11.14	$843.19
2019	$276.56	$239.59	$198.05	$40.73	$62.95	$56.25	$11.76	$885.90

* - PGBT EE toll revenue shown in the Table is the NTTA's share of the toll revenue

THIS PAGE INTENTIONALLY LEFT BLANK

Section 1
Introduction

This report documents the methodology, process, and results of a comprehensive traffic and revenue (T&R) study as requested of CDM Smith by the North Texas Tollway Authority (NTTA). The study included a system-wide review, traffic and socioeconomic data collection and analysis, and development of an independent fifty-year T&R forecast for the NTTA System.

Figure 1-1 illustrates the NTTA System, which currently includes the following:

- **Dallas North Tollway (DNT)**
  - Limits: IH 35E in Dallas to US 380 in Frisco
  - Length: Approximately 31 miles
- **President George Bush Turnpike (PGBT), Excluding Eastern Extension**
  - Limits: Belt Line Road in Irving to SH 78 in Garland
  - Length: Approximately 30 miles
- **President George Bush Turnpike Eastern Extension (PGBT EE)**
  - Limits: SH 78 in Garland to IH 30 in Garland
  - Length: Approximately 10 miles
- **Sam Rayburn Tollway (SRT)**
  - Limits: Business 121 in Coppell to US 75 in McKinney
  - Length: Approximately 26 miles
- **Addison Airport Toll Tunnel (AATT)**
- **Lewisville Lake Toll Bridge (LLTB)**
- **Mountain Creek Lake Bridge (MCLB)**

Also shown in Figure 1-1 is the Special Projects System, which is comprised of the following:

- **President George Bush Turnpike Western Extension (PGBT WE)**
  - Limits: IH 20 in Grand Prairie to SH 183 in Irving
  - Length: Approximately 10 miles
- **Chisholm Trail Parkway (CTP)**
  - Limits: US 67 in Cleburne to IH 30 in Fort Worth
  - Length: Approximately 28 miles

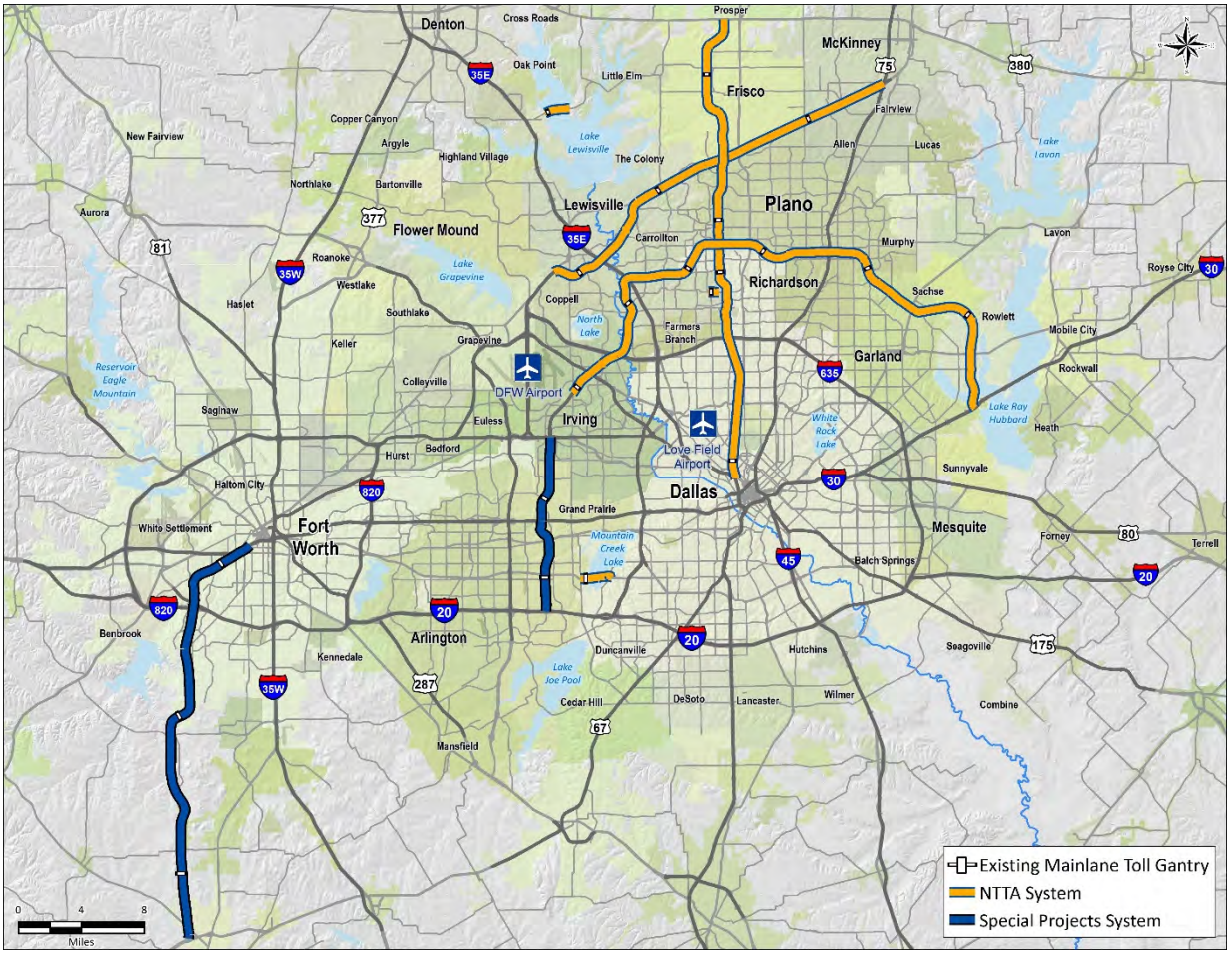

Figure 1-1.
Current NTTA System and Special Projects System

BACKGROUND AND AUTHORITY FOR STUDY

This study builds upon previous T&R studies, the most recent of which is the NTTA System Comprehensive Traffic and Toll Revenue Study, prepared by CDM Smith in December 2016 (the "December 2016 Study"). The North Central Texas Council of Governments (NCTCOG) adopted a new metropolitan transportation plan (MTP) in March 2016 called Mobility 2040. The updated travel demand model roadway networks from the new MTP were incorporated into the T&R estimates included in the December 2016 Study, which also included an independent economic review of the Mobility 2040 demographics along the NTTA corridors as well as comprehensive traffic count and travel time data collection. In addition, observed transaction and revenue trends were incorporated into the analysis.

The December 2016 Study focused solely on the existing NTTA System, which is currently comprised of the DNT, PGBT, PGBT EE, SRT, AATT, MCLB and LLTB. NTTA's other two roadways, PGBT WE and CTP, are currently part of the Special Projects System. It is anticipated that the NTTA System will be expanded to include CTP and PGBT WE following the refunding of the Special Projects System bonds and other debt in the fall of 2017. Therefore, CTP and PGBT WE have been incorporated into this current study, and the T&R forecasts presented in this report will include these two facilities. For the purposes of this

current study, the term "NTTA System" henceforth will be used to describe this future condition, inclusive of PGBT WE and CTP, as shown in Figure 1-2.

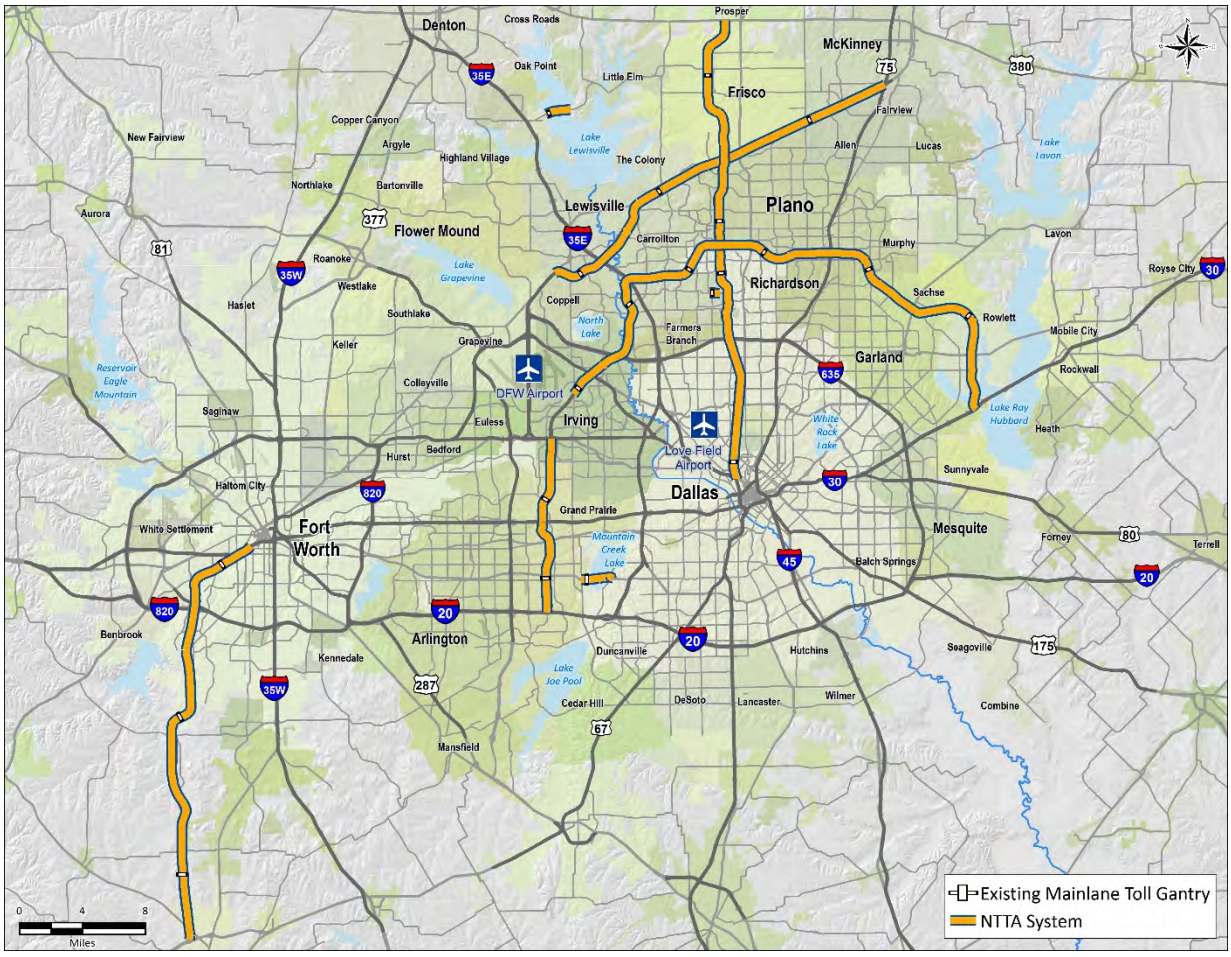

Figure 1-2.
Expanded NTTA System

OBJECTIVE AND SCOPE OF STUDY

The purpose of this study is to develop T&R forecasts for the NTTA System (see Figure 1-2). The following outlines the general structure of the report:

Section 2 – Current Traffic Trends and Characteristics

This section provides background information regarding the characteristics of NTTA's roadways and the highway infrastructure near NTTA System corridors. The information in this section provides a historical overview of traffic in the vicinity of the corridors, which was used as input when developing the T&R forecasts. This section also describes the additional data that was collected, which included traffic counts at specific locations around NTTA System corridors and travel time data on the NTTA System and other nearby roadways.

Section 3 – Dallas-Fort Worth Area Transportation Characteristics

This section contains a broad overview of the transportation system in the Dallas-Fort Worth (DFW) region and outlines the region-wide characteristics that may impact the NTTA System. The Mobility 2040 transportation commitments are described in this section.

Section 4 – Regional Demographic and Economic Trends

This section provides a description of the NCTCOG forecast process used to generate the base demographics and details the historical and expected future growth in the DFW region. The historical and expected future growth of the individual counties within the study area is also investigated followed by a description of the demographic characteristics along NTTA System corridors. Research and Demographic Solutions (RDS) performed an independent economic review of the official demographic datasets. RDS's socioeconomic review report is included as Appendix A at the end of this report. Their findings included the identification of necessary modifications to the regional growth projections within their study focus area. These modified growth projections were incorporated into the NCTCOG travel demand model resulting in an alternate set of trip tables. This alternate set of trip tables is referred to as the "revised" trip tables which were used for traffic forecasting and revenue estimation.

Section 5 – Travel Demand Model Development

This section describes the databases utilized as part of the analysis and highlights the methodologies implemented to calibrate and validate the travel demand model. The model is used to forecast future traffic on toll facilities, and is calibrated to ensure it is capable of replicating current traffic conditions along NTTA System corridors.

Section 6 – Estimated Traffic and Revenue

This section provides the updated traffic forecasts and revenue estimates for the NTTA System. The toll sensitivity analyses performed as part of the study are described in detail in this section, including several sensitivity tests to measure impacts of changes to key input variables to the base T&R forecasts. Also presented are the average weekday transactions and annual toll revenues anticipated on the NTTA System, as well as a description of the various assumptions used in the forecasting process.

Section 2

Current NTTA System Traffic Trends and Characteristics

This section provides background information regarding the characteristics of NTTA System facilities and the highway infrastructure near the NTTA System. The information in this section provides a historical overview of traffic in the vicinity of the NTTA System, which was used as input when developing the traffic and toll revenue forecasts. This section also describes the additional data that was collected, which includes traffic counts at specific locations around the NTTA System corridors and travel time analysis on the NTTA System facilities and other roadways along the NTTA System corridors.

NTTA SYSTEM FACILITIES IN OPERATION

The NTTA System facilities currently in operation are the Dallas North Tollway (DNT), President George Bush Turnpike (PGBT), President George Bush Turnpike Eastern Extension (PGBT EE), Sam Rayburn Tollway (SRT), Addison Airport Toll Tunnel (AATT), Mountain Creek Lake Bridge (MCLB), Lewisville Lake Toll Bridge (LLTB), President George Bush Turnpike Western Extension (PGBT WE) and Chisholm Trail Parkway (CTP).

Dallas North Tollway

The DNT, shown in Figure 2-1, is currently functioning as a limited-access, high-speed toll facility which extends northward from the junction with Stemmons Freeway (IH 35E) north of downtown Dallas through the Dallas suburbs to US 380 in Frisco. The existing DNT covers a distance of approximately 31 miles. The original DNT, which extended from its current southern terminus to IH 635, was constructed and opened to traffic in its entirety in June 1968. It was extended to Frankford Road in June 1987 and to Legacy Road in Plano in September 1994. In April 2004, with the completion of the grade-separated multi-level interchange with SRT, the DNT was extended north to just south of Gaylord Parkway in Frisco. The Extension Phase 3 extended the DNT from Gaylord Parkway to US 380 and opened to traffic on September 28, 2007. The opening sequence for the DNT is shown in Table 2-1. The existing DNT utilizes a "closed" toll collection system. Each of the four major sections of the facility have one mainlane toll gantry at which tolls are collected in both directions, with toll gantries positioned at selected ramps to prohibit toll-free movements on the facility. The sections of the DNT north of IH 635 are flanked by city- or county-maintained service roads.

Table 2-1. Opening Sequence of DNT

Project Phasing	Segment	Completion Date
Phase 1	IH 35E to IH 635	June 1968
Phase 1 Extension	IH 635 to Frankford Road	June 1987
Phase 2	Frankford Road to Legacy Road	September 1994
Phase 2 Extension	Legacy Road to Gaylord Parkway	April 2004
Phase 3 Extension	Gaylord Parkway to US 380	September 2007

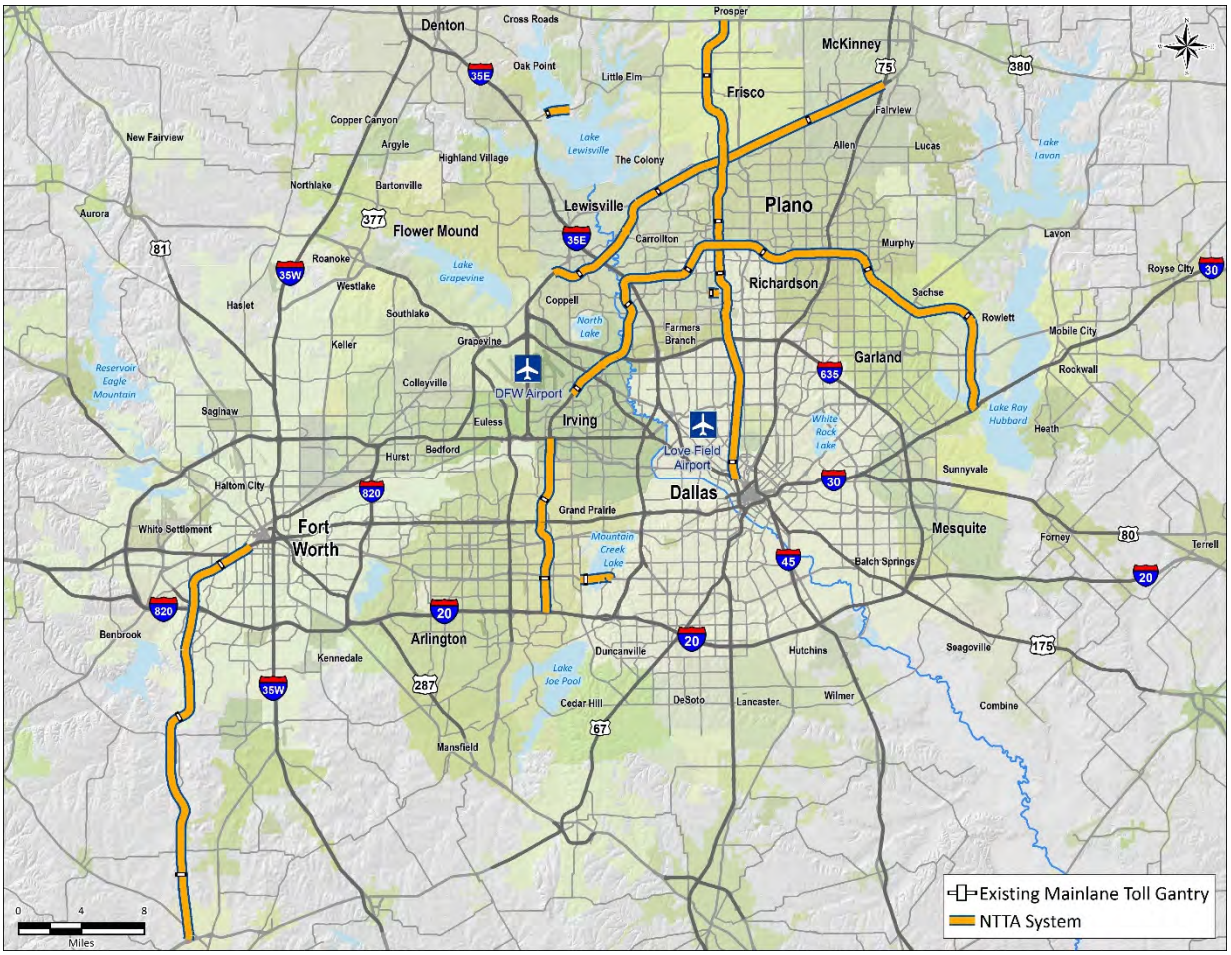

Figure 2-1.
The NTTA System

Access to the DNT is currently provided by a series of full interchanges located at Mockingbird Lane, Northwest Highway, Royal Lane, IH 635, Spring Valley Road, Belt Line Road, Keller Springs Road, Frankford Road, PGBT, West Park Boulevard, Parker Road, Spring Creek Parkway, SRT, John Hickman, Stonebrook Parkway, Cotton Gin Road, and Eldorado Parkway. Additional access is provided via partial interchanges located at Oaklawn Avenue, Wycliff Avenue, Cedar Springs Road, Lemmon Avenue, Lovers Lane, Walnut Hill Lane, Forest Lane, Harvest Hill Road, Alpha Road, Trinity Mills Road, Plano Parkway, Windhaven Parkway, Legacy Drive, Headquarters Drive, Gaylord Parkway, Panther Creek Parkway and CR 24.

President George Bush Turnpike (Including Eastern Extension)

As illustrated in Figure 2-1, the PGBT (including Eastern Extension) currently extends from the junction with IH 30 at its eastern end, traversing the communities of Rowlett, Garland and Richardson to a junction with US 75. The PGBT continues westward through the cities of Plano and Dallas to an interchange with the DNT. The facility then continues in a southwesterly direction through Carrollton to the interchange with IH 35E. At this point from IH 35E, the PGBT turns due south, along the section referred to as Segment IV, to the interchange with IH 635. From IH 635, the PGBT section referred to as Segment V continues southwesterly through the city of Irving to the northern terminus of the existing

SH 161 mainlanes in the vicinity of Belt Line Road just east of the DFW International Airport. The entire PGBT, from IH 30 to Belt Line Road covers a total distance of approximately 40 miles. The opening sequence of the PGBT facility is shown in Table 2-2.

Table 2-2. Opening Sequence of PGBT (Including Eastern Extension)

Project Phasing	Segment	Completion Date
Segment I A	Midway Road to Preston Road	November 1998
Segment I B	Preston Road to Coit Road	June 1999
Segment I C	Coit Road to US 75	December 1999
Segment II A	US 75 to Campbell Road	December 1999
Segment II B	Campbell Road to SH 78	April 2000
Segment III	Midway Road to IH 35E	July 2001
Segment IV	IH 35E to IH 635	September 2005
Segment V	IH 635 to Beltline Road	December 2001
Eastern Extension	SH 78 to IH 30	December 2011

The PGBT utilizes a "semi-closed" system of toll collection. The PGBT has six mainlane gantries positioned along the entire length of the facility with ramp gantries located on selected ramps along the project. Early in the PGBT planning process, it was decided that free access would be provided to the interchanges located at SH 78, US 75 and IH 35E, thus not meeting the requirements of a traditional "closed" toll collection system. Selected portions of the PGBT are flanked by city- or county-maintained frontage roads.

Access to the completed PGBT is provided by full interchanges located at IH 30, New Merritt Road, Firewheel Parkway, SH 78, North Garland Avenue, Campbell Road, Renner Road, Jupiter Road, US 75, Independence Parkway, Coit Road, Preston Road, DNT, Josey Lane, Old Denton Road, IH 35E, Sandy Lake Road, Belt Line Road, Valley View Lane and Royal Lane. Partial interchanges are located at Miller Road, Main Street, SH 66, Merritt Road, Miles Road, Shiloh Road, Plano Road, Alma Drive, Custer Drive, Midway Road, Rosemeade Parkway, Marsh Lane, Frankford Road, Kelly Boulevard, IH 635, Las Colinas Boulevard, SH 114, Gateway, and Belt Line Road. Additional intermediate access is allowed via a system of frontage roads and slip ramps.

Sam Rayburn Tollway

The SRT corridor is approximately 26 miles in length and runs in a northeast/southwest direction between the interchange of US 75 in McKinney and Denton Tap Road near the bridge over Denton Creek in Coppell. The corridor is crossed by several arterial streets as well as the DNT and IH 35E. The opening sequence for the SRT is shown in Table 2-3. The SRT currently utilizes a "semi-closed" system of toll collection. Toll-free sections are currently located near the interchanges with IH 35E and the DNT.

Table 2-3. Opening Sequence of SRT

Project Phasing	Segment	Completion Date
Phase 1	Denton Tap Road to Old Denton Road	July 2006
Phase 2	Old Denton Road to Coit Road	August 2008
Phase 3	Coit Road to Hardin Boulevard	September 2009
Phase 4A	Hardin Boulevard to US 75	December 2010
Phase 4B	Interchange at US 75	March 2011*
Phase 5	Interchange at DNT	December 2011

*Four major direct connectors at this interchange were opened in December 2010

Addison Airport Toll Tunnel

The AATT is located in the town of Addison to the west of the DNT between IH 635 and the PGBT as shown in Figure 2-1. The AATT is a connector for Keller Springs Road and covers a distance of approximately 3,700 feet from Midway Road to Addison Road with the actual tunnel length being 1,600 feet long traveling under the Addison Airport runway. The AATT is a two-lane facility and is served by a single two-way toll gantry located at the western terminus. The AATT opened to traffic in February 1999.

Mountain Creek Lake Bridge

The MCLB is located in southwest Dallas and crosses Mountain Creek Lake and connects to Spur 303 on either side. The total length of the MCLB including approach roads is approximately two miles. The MCLB is a two lane facility served by a single two-way toll gantry located at its western terminus. The MCLB was opened to traffic on April 30, 1979.

Lewisville Lake Toll Bridge

The LLTB is a 1.7-mile four-lane bridge in Denton County that is served by a single two-way toll gantry located at its western terminus. The western and eastern ends of the bridge lie in the cities of Lake Dallas and Little Elm, respectively. The LLTB is part of a corridor that runs from IH 35E in Lake Dallas to the Dallas North Tollway in Frisco and was opened to traffic on August 1, 2009.

President George Bush Turnpike Western Extension

The PGBT WE toll facility is approximately 11.5 miles long and runs from IH 20 in Grand Prairie to SH 183 in Irving. The corridor crosses several major east/west highways and arterials, including IH 20, SH 180 (Main Street), IH 30, and SH 183. Spur 303/Pioneer Parkway, which connects directly to the Mountain Creek Lake Toll Bridge, also crosses the PGBT WE corridor. Running parallel to PGBT WE are SH 360, FM 157/Collins Road in Arlington, Carrier Parkway and Belt Line Road in Grand Prairie and Irving, and Loop 12/Spur 408 in Dallas are potential north/south competing routes. PGBT WE was opened in phases, and the opening sequence of the facility is summarized in Table 2-4.

Table 2-4. Opening Sequence of PGBT WE

Project Phasing	Segment	Completion Date
Phase 1	SH 183 to Conflans Road	August 2009
Phase 2	Conflans Road to Egyptian Way	August 2009
Phase 3	Conflans Road to Egyptian Way (additional mainlanes)	April 2010
Phase 4	Egyptian Way to IH 20	October 2012

Chisholm Trail Parkway

The CTP is approximately 27.6 miles long and extends from US 67 in the City of Cleburne to IH 30 in the City of Fort Worth. The corridor crosses FM 1187, SH 183, and IH 20, as well as several east/west arterial routes including Vickery Boulevard, Berry Street, Seminary Drive, Altamesa Boulevard, and Sycamore School Road. Additionally, US 377, Vickery Boulevard, Bryant Irvin Road, Hulen Street, Granbury Road, SH 174 and IH 35W are potential north/south competing routes.

TOLL COLLECTION SYSTEM AND RATES

The following section provides a summary of the existing NTTA System toll collection configuration and toll rates. Also included is a comparison of DNT, PGBT, SRT, PGBT WE and CTP per mile toll rates with other similar toll facilities throughout the United States. A brief description of the NTTA TollTag and ZipCash systems is also provided.

TollTag Program

In July 1989, a voluntary subscription electronic toll collection (ETC) system based on automatic vehicle identification (AVI) was installed on DNT. Prior to August 1, 1999 the program, known as TollTag, charged patrons a slightly higher toll and a monthly service fee. Subsequent to August 1, 1999, TollTag and cash patrons were assessed tolls under the revised cash differential, $0.60/$0.75 toll rate scenario. On January 1, 2002, this same $0.60/$0.75 toll rate concept was implemented on the PGBT. Since its introduction, the TollTag program has gained substantial popularity by assisting in the reduction of patron delay at toll gantries. Approximately 15,000 TollTags were in circulation in 1989, which more than doubled to approximately 32,000 by the end of 1990 and reached the milestone of one million in November 2005. According to the NTTA website, there were more than 3.7 million TollTags in circulation in 2015.

ZipCash Program

Between 2007 and 2010, the NTTA replaced its cash toll collection system with an all-electronic toll collection (AET) system that includes the ZipCash program. The ZipCash system allows travelers to use NTTA facilities without a TollTag. When a motorist without a TollTag drives through tolling points, high-speed cameras take digital images of the license plate, and the tolls are billed to the registered owner of the vehicle. ZipCash toll rates are typically 50 percent higher than TollTag rates, reflecting the higher costs of collection. This surcharge is added to each toll to cover the costs of processing.

NTTA completed the conversion of all its existing toll roads, bridges and tunnels to AET in December 2010. The SRT and LLTB were opened to traffic in 2008 and 2009 with an AET system and never offered a cash option. DNT's mainlane gantry near Wycliff Avenue was the first toll collection location that was converted to ZipCash in early 2007, and the first NTTA full facility to be converted from cash to AET was the PGBT in July 2009. Conversions of the rest of the DNT, AATT and MCLB followed in December 2010.

NTTA System Toll Rates

On July 1, 2009, a new toll policy went into effect on the NTTA System. This toll policy was amended in late 2011, prior to the opening of the Eastern Extension of the PGBT, which includes changes to the toll escalation rate on the PGBT EE and toll revenue sharing terms with the TxDOT. Under the new toll rate policy, the base toll rate for AVI users on DNT, PGBT, SRT and PGBT WE was set at $0.145 per mile (in 2009 dollars). On CTP, the per mile rate (in 2009 dollars) has been set at $0.185 for the segment between IH 30 and Altamesa Boulevard and $0.145 per mile for the segment between Altamesa Boulevard and US 67. The per mile rates are to be adjusted every two years at an annual growth rate of 2.75 percent on all facilities. The most recent toll rate adjustment under this new policy took place on July 1, 2017, and the current per mile AVI rate on NTTA System facilities for two-axle vehicles is approximately $0.1801 per mile. This rate applies to users with TollTags as well as other tags supported by the NTTA's various interoperability agreements.

NTTA has adopted an axle-based vehicle classification system for determining the toll that each vehicle pays. For example, tolls charged to vehicles with five axles are four times the toll charged to vehicles

with two axles. Currently, all NTTA System facilities operate under cashless (ZipCash) toll collection system, where the license plates of vehicles without valid transponders using these facilities are photographed and are invoiced at a higher toll than the AVI toll.

Dallas North Tollway

As shown in Figure 2-2, the southernmost Mainlane Gantry 1 (MLP 1) is located between Wycliff Avenue and Cedar Springs Road. Ramp toll collection facilities within the original portion of the DNT are located at Mockingbird Lane, Northwest Highway and Royal Lane to and from the north only. On the Extension Phase 1, the MLP 2 is located between Keller Springs Road and Trinity Mills Road. Ramp toll collection facilities within the Extension Phase 1 are located at Spring Valley Road, Belt Line Road and Keller Springs Road to and from the south, and at Frankford Road to and from the north.

The MLP 3 on the Extension Phase 2 is located between Chapel Hill Boulevard and Parker Road. Ramp toll collection facilities within the Extension Phase 2 are located to and from the south at West Park Boulevard, and to and from the north at Parker Road and Spring Creek Parkway. In addition, with completion of the SRT/DNT interchange ramp toll collection facilities are located to and from the south on the ramps just north of SRT.

On the Extension Phase 3, the MLP 4 is located between Main Street and Eldorado Parkway. Ramp toll collection facilities within the Extension Phase 3 are located to and from the south of John Hickman, Stonebrook Parkway, and Cotton Gin Road. Additional ramp toll collection facilities are located to and from the north of Eldorado Parkway.

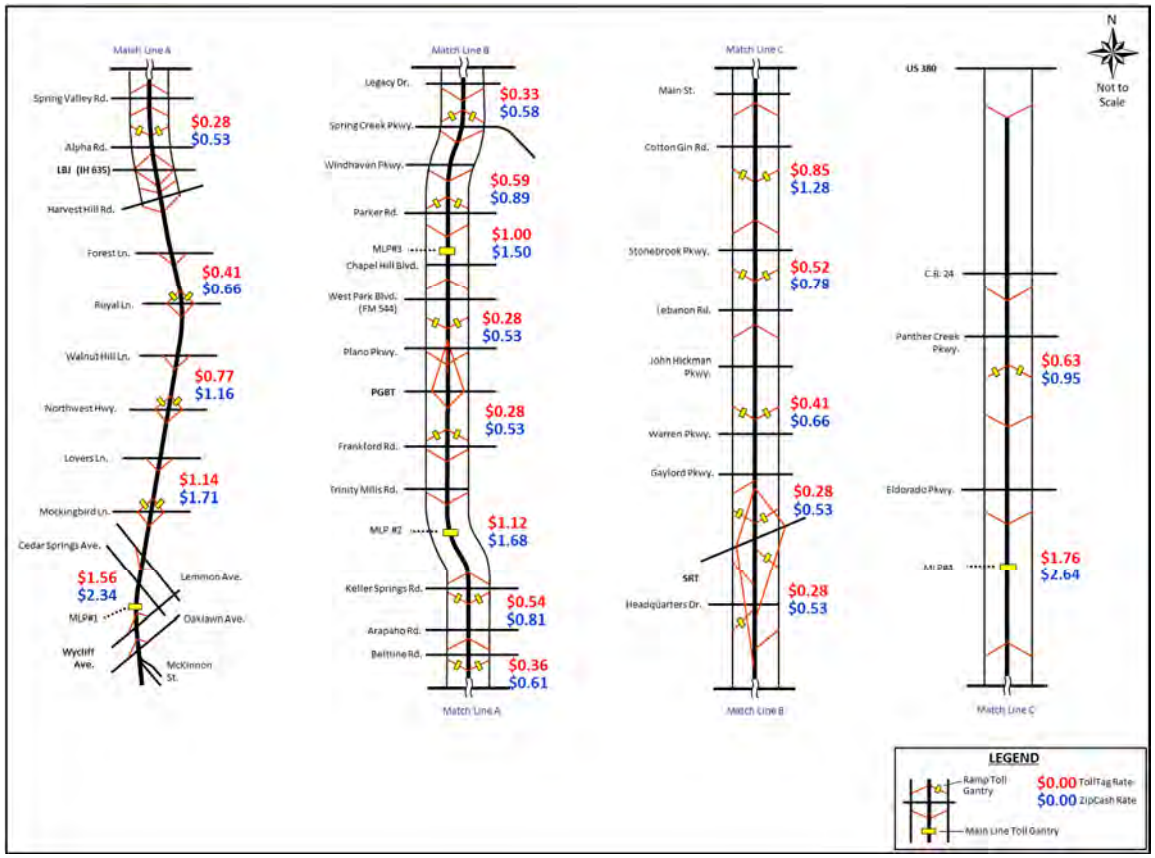

Figure 2-2.
Current (2017) DNT Toll Collection System and Passenger Car Toll Rates

President George Bush Turnpike (Including PGBT EE)

The collection system for the PGBT is presented in Figures 2-3 and 2-4. There are six mainlane gantries between IH 30 in the city of Garland and Belt Line Road in the city of Irving. MLP 5 is located near Merritt Road; MLP 6 is positioned between Shiloh Road and Renner Road; MLP 7 is located between Coit Road and Hillcrest Road; MLP 8 is placed between Frankford Road and Kelly Boulevard; MLP 9 is set between Sandy Lake Road and Belt Line Road in Carrollton/Farmers Branch; and MLP 10 is located between Gateway Road and Belt Line Road in Irving.

When traveling eastbound on the PGBT, the on-ramp toll gantries are located west of Gateway Road, east of Royal Lane, east of Marsh Lane, east of Midway Road, east of Coit Road, west of Custer Drive, east of Shiloh Road, east of Campbell Road, east of Garland Avenue, east of Merritt Road, east of Main Street and east of Miller Road. Off-ramp toll gantries are located west of Belt Line Road, west of Josey Lane, west of Kelly Boulevard, west of Preston Road, east of Jupiter Road, east of Renner Road, west of Crist Road, west of Firewheel Parkway and west of Miles Road.

When traveling westbound on the PGBT the on-ramp toll gantries are located west of Miles Road, west of Firewheel Parkway, west of Crist Road, east of Renner Road, east of Jupiter Road, west of Preston Road, west of Kelly Boulevard, west of Josey Lane and west of Belt Line Road, while the off-ramp toll gantries are located east of Miller Road, east of Main Street, east of Merritt Road, east of Garland Avenue, east of Campbell Road, east of Shiloh Road, west of Custer Drive, east of Coit Road, east of Midway Road, east of Marsh Lane, east of Royal Lane and west of Gateway Road.

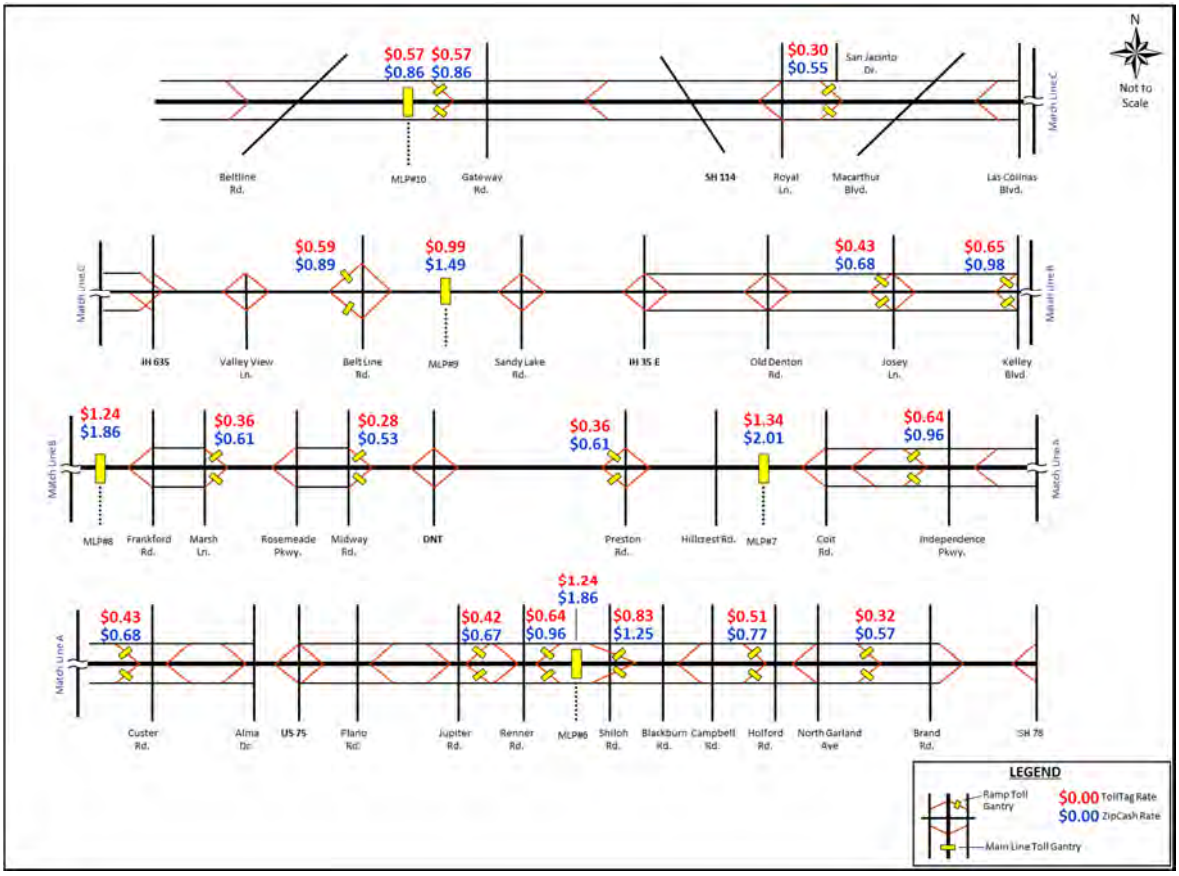

Figure 2-3.
Current (2017) PGBT (Excluding PGBT EE) Toll Collection System and Passenger Car Toll Rates

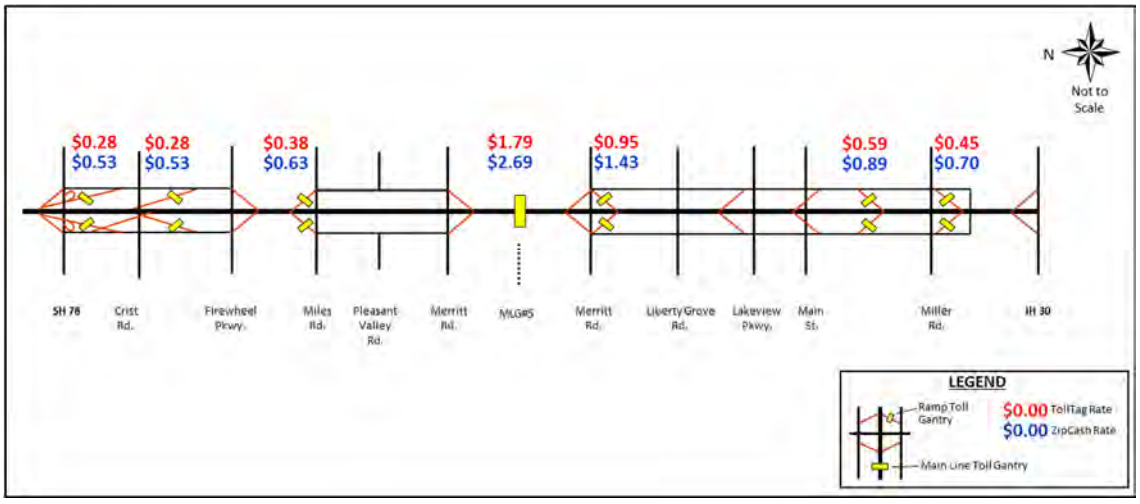

Figure 2-4.
Current (2017) PGBT EE Toll Collection System and Passenger Car Toll Rates

Sam Rayburn Tollway

Tolls are currently collected on the SRT at three mainlane gantries and forty ramp gantries as shown in Figure 2-5. The mainlane gantries are located near Denton Tap Road, Josey Lane and Custer Road. The ramp gantries are located at MacArthur Boulevard, Carrollton Parkway, Parker Road, FM 2281, Standridge Drive, Josey Lane, Plano Parkway, Spring Creek Parkway, Preston Road, Ohio Drive, Coit Road, Independence Parkway, Custer Road, Alma Drive, Stacy Road, Lake Forest Drive and Hardin Boulevard.

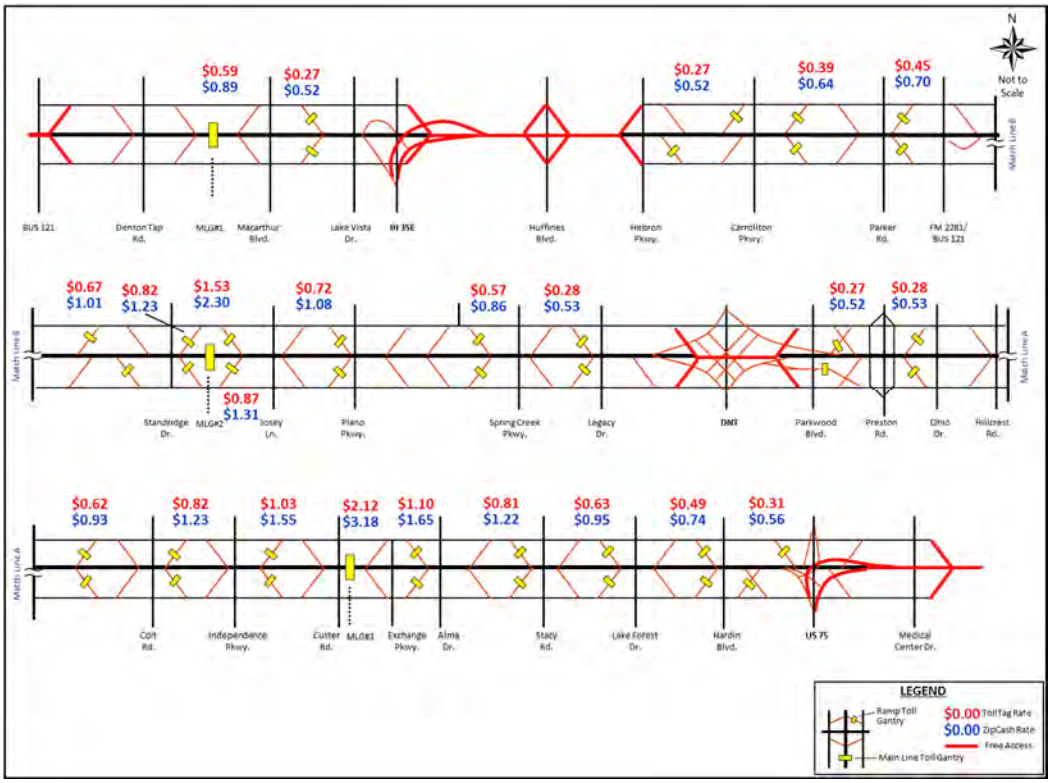

Figure 2-5.
Current (2017) SRT Toll Collection System and Passenger Car Toll Rates

President George Bush Turnpike Western Extension

Tolls are currently collected on the PGBT WE at two mainlane gantries and eighteen ramp gantries as shown in Figure 2-6. The mainlane gantries are located near Lower Tarrant Road and Arkansas Lane. The ramp gantries are located at Conflans Road, Shady Grove Road, Lower Tarrant Road, Dalworth Street, Marshall Drive, Pioneer Parkway, Arkansas Lane and Mayfield Road.

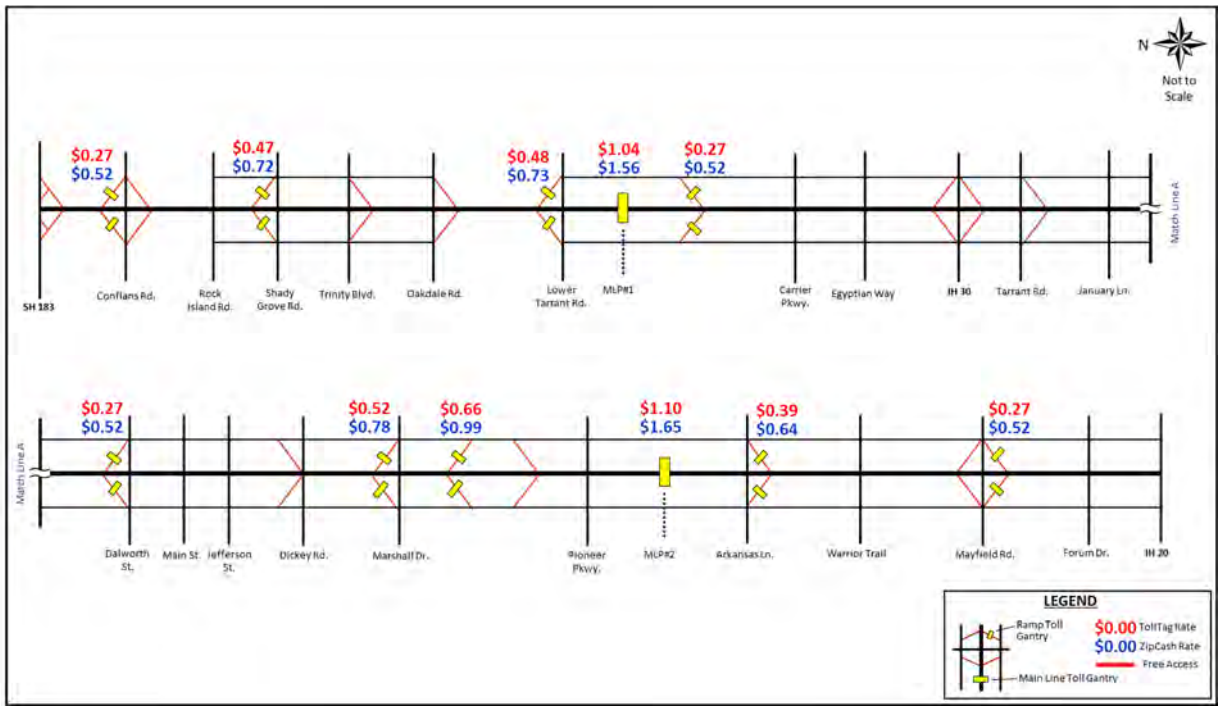

Figure 2-6.
Current (2017) PGBT WE Toll Collection System and Passenger Car Toll Rates

Chisholm Trail Parkway

Tolls are currently collected on the CTP at three mainlane gantries and twenty-four ramp gantries as shown in Figure 2-7. The mainlane gantries are located near Hulen Street, FM 1187 and CR 904. The ramp gantries are located at Edwards Ranch Road, Arborlawn Drive, Oakmont Boulevard, Altamesa Boulevard, Sycamore School Road, McPherson Boulevard, FM 1187, CR 920, CR 913, FM 917, CR 904 and Sparks Drive.

AATT, MCLB and LLTB

As stated previously, the AATT, MCLB and LLTB are each served by a single mainlane toll gantry. The mainlane gantry for the AATT is positioned at the western terminus of the tunnel. The mainlane gantry for the MCLB is located at the bridge's western terminus. The LLTB's mainlane gantry is located at the western end of the bridge in Lake Dallas.

The current toll rates (effective through June 30, 2019) on various NTTA gantries are shown in Table 2-5.

TollTag Rate
$0.180 per mile

ZipCash Rate
TollTag rate + 50% surcharge ($0.25 minimum)

Minimum Toll:
$0.27 (TollTag) / $0.52 (ZipCash)

Note: Tolls for vehicles with more than two axles are calculated using the (N-1) multiplier.

Comparison of Per-Mile Toll Rates

The average per-mile toll rates for passenger cars on the NTTA System are compared with other representative urban toll facilities throughout the United States in Figure 2-8. NTTA facilities are shown in red. In general, toll rates on the NTTA System fall within the range of rates on other urban toll facilities. Currently, the average per-mile toll rate for two-axle vehicles is approximately $0.1801 per mile on all NTTA facilities for TollTag/AVI users, while ZipCash users are charged $0.1801 per mile plus a 50 percent surcharge with a minimum surcharge of $0.248 per transaction.

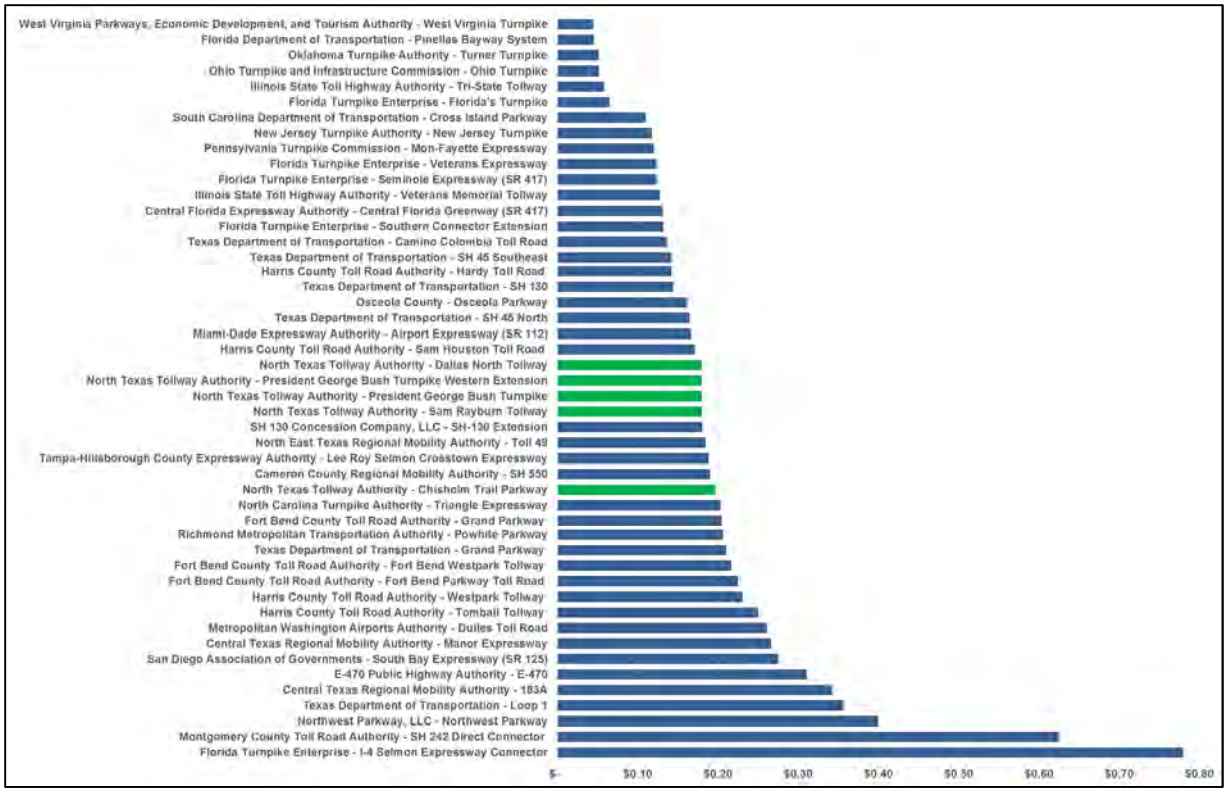

Figure 2-8.
Per Mile AVI Toll Rate Comparison to Other Toll Facilities

ANNUAL TRANSACTION TRENDS

CDM Smith evaluated transaction trends on the NTTA System from 2007 through 2017. This evaluation was used to provide a general understanding of the current, as well as historical, performance of the NTTA System facilities. The analysis provided useful insight into the effect that major toll configuration changes, such as the addition of extension projects, toll increases, the economic downturn between 2007 and 2010 have had on NTTA System growth trends.

Trends in Average Daily Transactions

Trends in annual average daily transactions from 2007 to 2016 for the NTTA System facilities are presented in Table 2-6 and are based on unaudited transaction data from NTTA. In 2016, daily transactions averaged approximately 714,500 on the DNT. Annual average daily transactions have grown by 1.8 percent since 2015, despite construction along the corridor. With the exception of 2009, transactions on DNT have experienced consistent positive growth over the last eight years, with the past five years showing strong growth. As the facility grows, expansions of the roadway are completed and economic development expands northward, transactions and revenues will likely remain robust.

As shown in Table 2-5, the opening of segments of the SRT in 2008 and 2009, as well as the economic downturn, had a negative impact on the PGBT's annual growth. Transactions on the PGBT declined by 1.5 percent between 2007 and 2008 and decreased by an additional 2.7 percent between 2008 and 2009. Transactions on the PGBT have seen consistent positive growth since that time, growing by 2.5 percent and 2.7 percent in 2015 and 2016, respectively. Since 2013, the transactions increased from 611,100 daily transactions to 669,500 transactions in 2016.

Transactions on the SRT increased in 2009 and 2010 by 21.0 and 28.5 percent, respectively, due to ramp up and the opening of new segments of the facility. The transaction growth has continued to be strong on the SRT as the facility has matured. SRT transactions grew by 7.7 percent in 2015 and by 7.3 percent in 2016. The PGBT EE, which opened in late December 2011, saw average daily transaction growth of 9.3 percent in 2016.

As indicated in Table 2-6, there was a consistent decrease in transactions on the AATT between 2007 and 2010 which could be partially attributed to the opening of the Arapaho Road Bridge in January 2006, which created a toll-free competing alternative parallel route for east-west traffic along the AATT corridor. AATT saw consistent positive transaction growth between 2011 and 2015 but declined by 5.6 percent in 2016.

Since its opening in November 1979, the MCLB has been subject to alternative periods of both positive and negative transactions and toll revenue growth, as is evident in Table 2-6. In recent years, however, transactions on the MCLB have typically seen positive growth.

Transactions on the LLTB has seen consistent positive transaction growth since its opening in 2009, and growth in transactions jumped noticeably in 2016 following the completion of the Eldorado Parkway corridor through Little Elm and Frisco.

Table 2-6. NTTA System Annual Average Daily Transactions (thousands)

Year	DNT	PGBT	SRT	PGBTEE	PGBTWE	CTP	AATT	MCLB	LLTB	Total
2007	535.3	501.6	--	--	--	--	5.8	8.4	--	**1,051.1**
2008	566.4	493.9	157.3	--	--	--	5.6	8.3	--	**1,231.5**
Change	5.8%	-1.5%	--	--	--	--	-3.8%	-1.2%	--	**17.2%**

Source: Unaudited NTTA Transaction Data

Trends in Monthly Transactions

Tables 2-7 through 2-13 show the monthly transactions for each facility from January 2007 through August 2017. As can be seen, there was a considerable drop in transactions on some facilities in the latter half of 2008 and early 2009 due to the economic downturn. However, the NTTA System has seen overall positive growth since 2007.

Average monthly transaction variations on the NTTA System facilities for 2016 are presented as an index of the monthly transactions, as illustrated in Table 2-14.

The peak travel months on the DNT in 2016 were March through October, while the lightest travel months on the DNT were February and November. Traffic volumes were below the 2016 average in January, February, June, July, September and November (monthly variations for these months ranged from one to four percent below the average). Traffic variations were one to three percent greater than the average in the remaining months.

The PGBT experienced above average transactions from March through October in 2016. The PGBT saw its lowest number of transactions in February. On the PGBT EE, travel peaked in May at four percent above the monthly average for the year. The SRT saw its peak month in August, with transactions at four percent higher than the annual average. Both the SRT and PGBT EE were at their lowest traffic levels in February, dropping six to eight percent below the annual average.

Peak travel on the PGBT WE in 2016 occurred June and August, during which transactions were four and five percent above the annual average, respectively. The lowest traveled month on PGBT WE in 2016 was January. The CTP experienced its lowest traffic in January and the highest transactions of the year in October. Both the AATT and LLTB experienced their highest traffic volumes in the summer months, while the MCLB experience its highest level of demand in April.

Table 2-14. NTTA System Monthly Transaction Index in 2016

Month	DNT	PGBT	SRT	PGBT EE	PGBT WE	CTP	AATT	MCLB	LLTB
January	98	95	93	95	91	90	99	92	88
February	96	95	92	94	93	91	100	100	88
March	103	102	100	100	102	98	105	105	96
April	102	101	99	99	101	98	99	107	97

AVI UTILIZATION TRENDS

As mentioned previously, the TollTag program has been successful in terms of increased participation since its introduction in July 1989. Current levels of AVI transaction shares for NTTA System facilities are presented in Figure 2-9. The AVI transaction shares shown represent the levels by month beginning in January 2015, and include VToll transactions with an assumed 90-day lag. As shown in Figure 2-7, the average AVI share across all NTTA System facilities has been trending upward and has consistently been above 80 percent since late 2016.

Figure 2-10 shows the spatial distribution of active TollTags across the Dallas-Fort Worth region from data in 2017. ZIP codes along the SRT and northern-most sections of the DNT have the highest concentration of the TollTags. Also, higher TollTag participation is seen in ZIP codes along the existing NTTA System corridors compared to the other parts of the region.

TollTag Utilization by ZIP Code

TRAFFIC COUNT PROGRAM

CDM Smith embarked on a comprehensive traffic count program in the NTTA System area. This included counts along all NTTA System corridors. The traffic count program included a series of screenlines. The locations of the traffic count screenlines can be seen in Figures 2-11 through 2-13. Traffic counts from the transaction data were obtained from NTTA staff for all of the existing mainlane gantries and each of the ramp toll gantries on all NTTA facilities. In addition, traffic counts were collected at strategic locations along NTTA System corridors, such as the frontage roads along the toll facilities to assist with the base year model calibration.

To collect data for non-NTTA facilities along the screenlines and for the non-tolled ramps along the NTTA facilities, CDM Smith engaged GRAM Traffic NTX, a Dallas-based firm that is classified as a Woman-Owned Business Enterprises (WBE). All of the counts at non-tolled locations and on the screenlines were conducted for a continuous 48-hour period on interior weekdays only (Tuesday, Wednesday and Thursday). By combining the ramp transaction data and the counts on the non-tolled ramps, CDM Smith was able to build an average weekday traffic profile for the NTTA System area. The results of the traffic count program were then used to calibrate the travel demand model.

A summary of the screenline traffic volumes is presented in Table 2-15.

Table 2-15.Screenline Traffic Summary

Screenline Location	Screenline Total Traffic Count	Screenline Location	Screenline Total Traffic Count
Dallas North Tollway		**President George Bush Turnpike**	
Screenline 1	829,100	Screenline 5	175,500
Screenline 2	718,600	Screenline 6	375,200
Screenline 3	406,000	Screenline 7	438,700
Screenline 4	266,100	Screenline 8	310,300
Sam Rayburn Tollway		Screenline 9	346,000

Screenline W3	201,200	Screenline C5	287,100

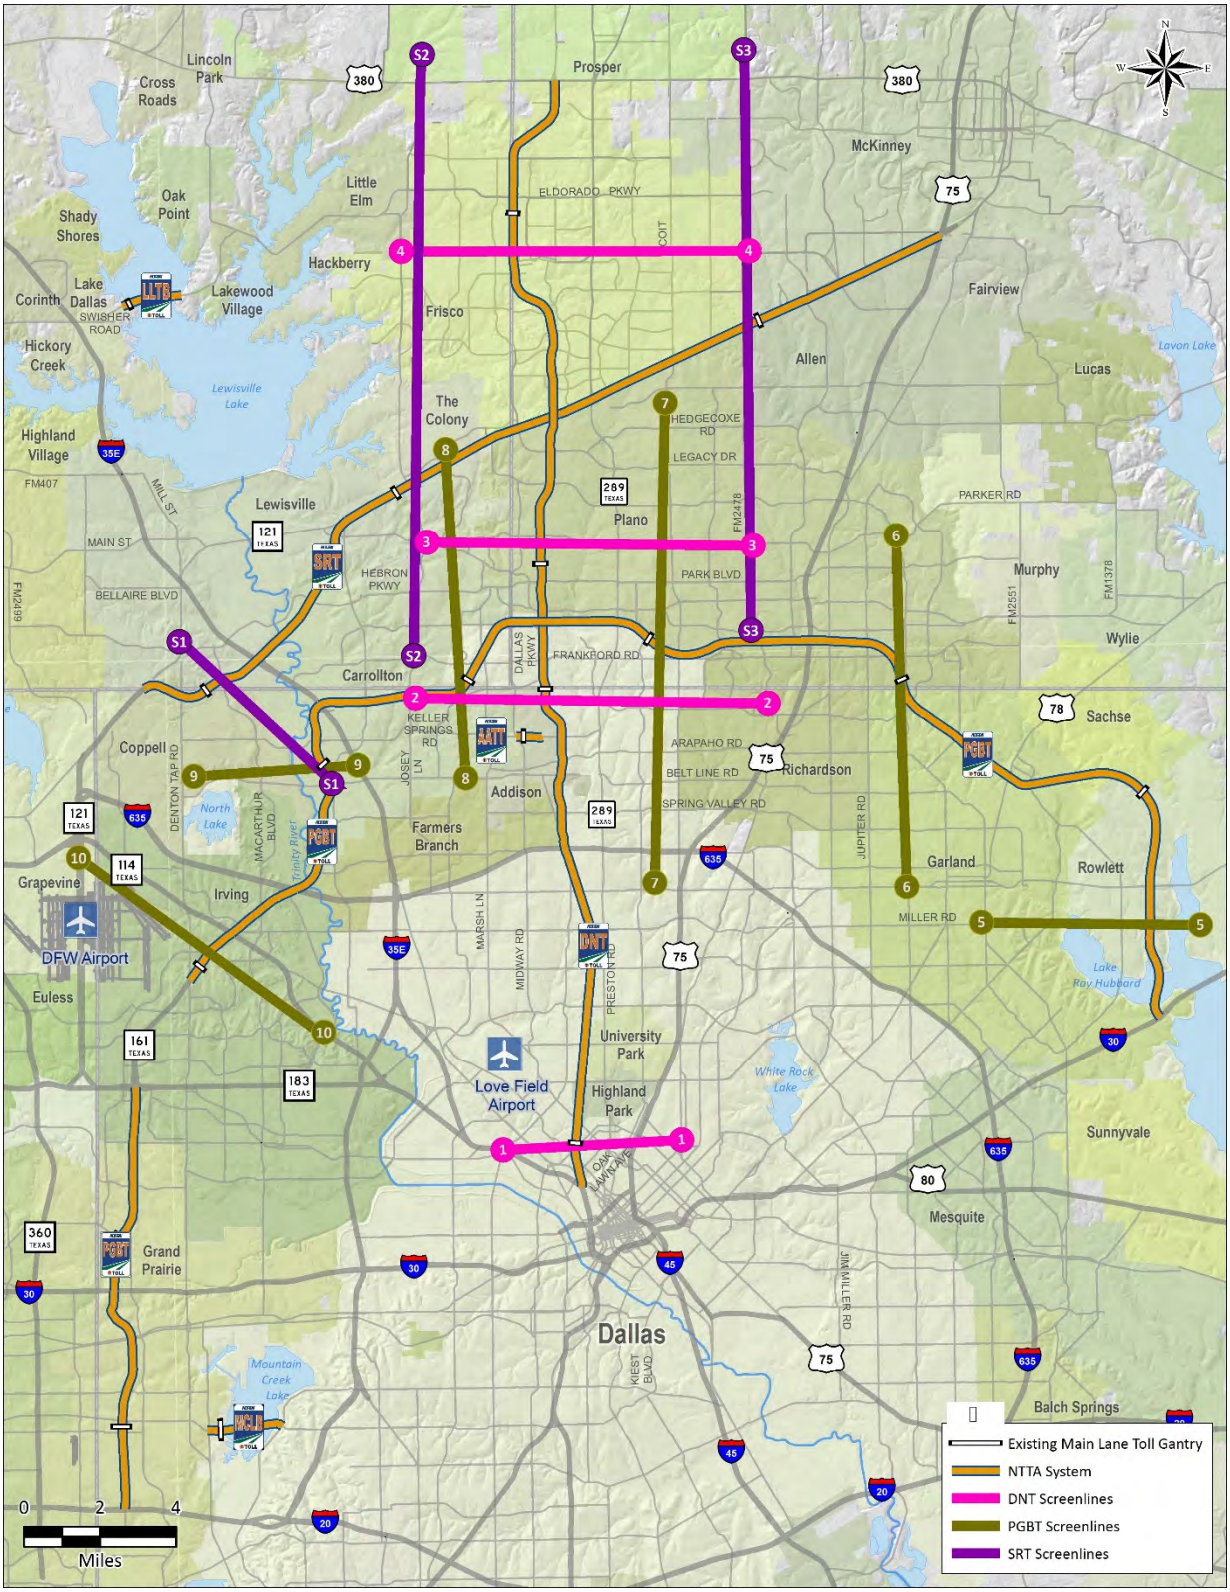

Figure 2-11.
DNT/PGBT/SRT Traffic Count Screenlines

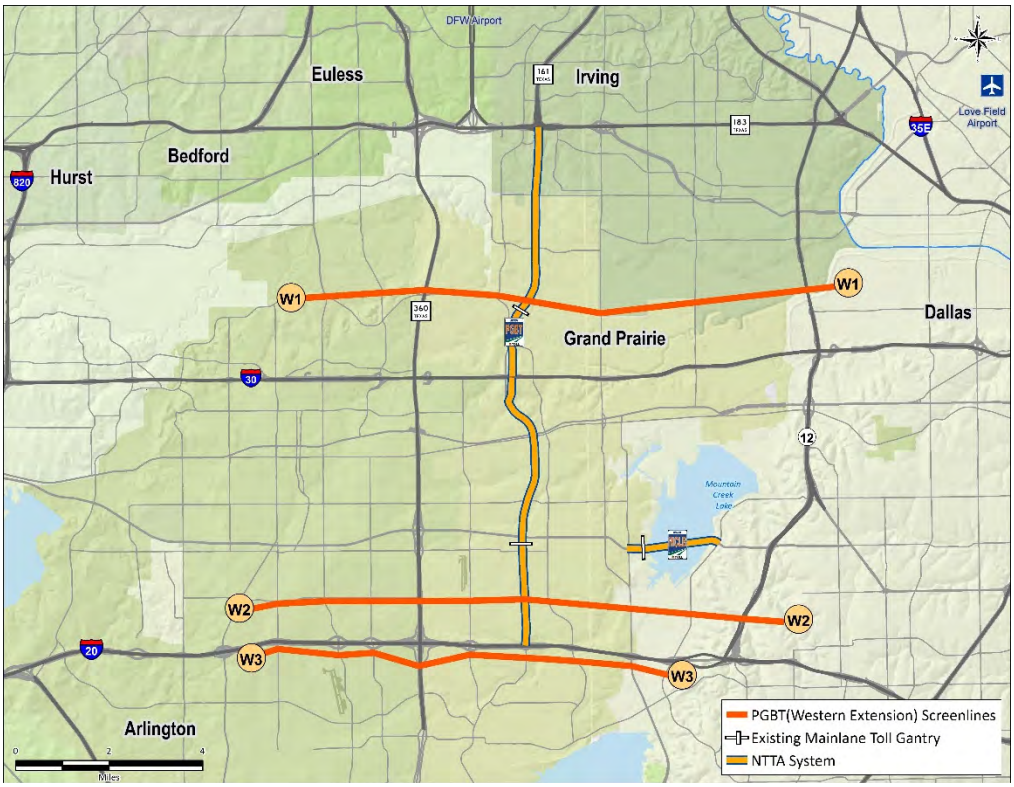

Figure 2-12.
PGBT WE Traffic Count Screenlines

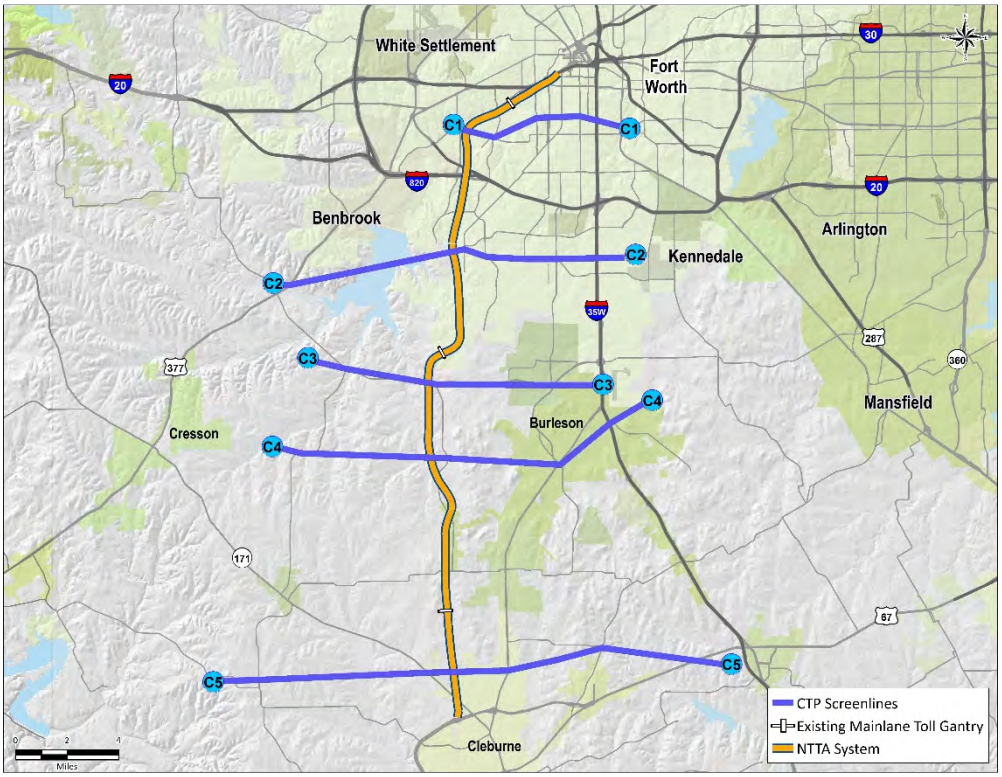

Figure 2-13.
CTP Traffic Count Screenlines

Figures 2-14 through 2-18 show the profile for both travel directions on the DNT, PGBT, SRT, PGBT WE and CTP for the AM, PM and off-peak (OP) time periods. The AM peak period is from 6:30 to 9:00 AM (2.5 hours), PM peak period is from 3:00 to 6:30 PM (3.5 hours), and the off-peak (OP) represents the remainder of the day (18 hours).

Dallas North Tollway

The northbound traffic during the PM peak period is higher than that in the AM peak and reflects the movement of traffic in the employment centers located along the southern and central portions of the DNT to the residential suburbs located along the northern segments of the DNT. During the PM peak, the highest volumes of traffic occur in the sections between MLP 2 and Legacy Drive. During the off-peak periods, highest volumes are seen between IH 635/LBJ and MLP 3. In the southbound direction, AM and PM peak traffic volumes seem to be similar south of Windhaven Parkway. The highest levels of traffic are experienced between IH 635/LBJ and MLP 3.

President George Bush Turnpike

In the eastbound travel direction, the PM peak period is generally higher than the AM peak period for the PGBT. This would also be expected because of the movements between employment centers along the DNT and the growing residential areas of Collin County. As a result, the highest volumes in both directions on PGBT were recorded between US 75 and the DNT.

Sam Rayburn Tollway

The eastbound travel direction indicates the PM peak period is higher than the AM peak period. In the westbound direction, the AM peak period is higher than the PM peak period for the section between DNT and Stacy Road. There is a noticeable spike in both directions for all time periods between Hebron Parkway and IH 35E. This spike is due to the fact that this section of the SRT is toll-free.

President George Bush Turnpike – Western Extension

On PGBT WE, travel in both the northbound and southbound directions is much heavier for the segment north of IH 30. Throughout the day, volumes on PGBT WE north of IH 30 are generally about twenty-five percent higher north of IH 30 than south of IH 30. The highest volumes on PGBT WE occur near Oakdale Road.

Chisholm Trail Parkway

Traffic on CTP is much higher in both directions at the northern end of the facility than the southern end. The highest volumes occur near MLG #1, while the lowest volumes occur near MLG #3. Generally, volumes decline consistently further south on the facility. The highest volumes at the northern end of the facility are approximately five times as high as the lowest volumes at the southern end of the facility.

Average Weekday Transactions by Location

Figures 2-19 through 2-24 show the estimated average weekday transactions in 2017 at each tolling location on the DNT, PGBT, PGBT EE, SRT, AATT, MCLB, LLTB, PGBT WE and CTP. As would be expected, the mainlane gantries generated the highest number of transactions on each facility. Among the ramp tolling locations, the Mockingbird Lane ramps generated the most transactions on the DNT, while the Midway Road ramps and Firewheel Parkway ramps generated the most transactions on the PGBT and PGBT EE, respectively. On the SRT, the highest number of ramp transactions was generated at the Custer Road ramps. On PGBT WE and CTP, the highest number of ramp transactions were generated and Lower Tarrant Road and Oakmont Boulevard, respectively.

TRAVEL TIME CHARACTERISTICS

The evaluation of a toll facility's future traffic and revenue requires knowledge of the current travel time characteristics of the major roadways in the project area. For the current study, travel time data was collected by two methods. The primary source was historical travel data obtained from INRIX, Inc., a traffic data company based in Washington State that maintains an archive of travel speed data for thousands of roadways across the United States accumulated from GPS-enabled devices along the highway network. INRIX is a Data as a Service (DaaS) company that monitors traffic flow along approximately 260,000 miles of major freeways, highways, urban and rural arterials, and side streets in the United States. This data provides historical as well as real-time traffic data seven days a week, 24 hours a day in as little as 5 minute increments for all metro areas with a population of more than one million. They were engaged to provide a series of travel speed data for several roadways within the study area.

INRIX obtains its data via crowd sourcing and collects travel speed information from various probes; including anonymous cell phones/smartphones and vehicles equipped with GPS devices (trucks, delivery vans, transit vehicles, etc.). The collected data is then processed in real-time to create travel speed information along most of the major roadways. The real-time travel speed data is normalized to account for parameters that affect traffic flow conditions, such as weather forecasts, school schedules, special events, accidents, seasonal variation, and road construction.

For routes within the proposed study area currently not captured by INRIX, the data was supplemented using a GPS-based speed data collection method. The time and location of each field vehicle was gathered using a GPS device every one-twentieth of a mile, and the operating speeds were then calculated. In the process of collecting speed data, CDM Smith staff gathered additional information regarding the number of lanes, speed limits, school zone locations, type of facility (divided vs. undivided) traffic signal locations and other geometric characteristics of the facilities surveyed. This information was used to calibrate the output speeds from the travel demand model to the existing conditions on those highway facilities.

In addition to NTTA's toll facilities, travel time analysis was also conducted on several local arterials and frontage roads that compete directly with NTTA System facilities. Several highway and arterial routes were selected for analysis to provide a profile of the fluctuation in operating speed throughout the corridor and the relationship between demand and congestion levels. For the DNT, PGBT, PGBT EE and SRT corridors, INRIX data was summarized for March 2016, and the GPS-based data was collected in January 2016. For the PGBT WE and CTP corridors, INRIX and GPS-based data was collected in June 2017. Figures 2-25 through 2-30 show the locations for which travel time data was obtained.

The results are presented graphically in Figures 2-31 through 2-42. The figures illustrate the typical peak period speeds in each direction on various facilities. As expected, the DNT routes exhibit their slowest speeds in the southbound AM and northbound PM directions. The PGBT routes exhibit their slowest speeds in the westbound AM and eastbound PM directions. Similar to the PGBT, the SRT show slower speeds in the westbound direction in the AM peak and in the eastbound during the PM peak period. In both the PGBT WE and CTP corridors, slower speeds are experienced in the northbound direction during the AM peak period and in the southbound direction during the PM peak period.

STATED PREFERENCE SURVEY

CDM Smith engaged Resource Systems Group (RSG) to conduct NTTA System stated preference (SP) surveys between March and April 2011. These SP surveys focus on travel preferences as they relate to the cost and reasons for selecting or not selecting toll roads. This type of survey is used to determine travelers' willingness to pay to use toll facilities.

A report from RSG that describes the NTTA System travel surveys and includes an analysis of the survey results is included as an appendix in the October 2011 Study. RSG's report describes the questionnaire used for the survey, the survey administration approach, analysis of the survey responses, estimation of the values of time and expected delay. RSG also provided an updated letter with recommendations on how to estimate the revised value of time for 2016. RSG recommended adjusting values of time by a factor of 1.0098 to reflect changes in real income and 1.049 to bring the values up to 2016$, for a total adjustment factor of 1.059.

Included in the RSG report are the following appendices:

- Appendix A contains a detailed description of the survey questionnaire and survey logic
- Appendix B includes screenshots of the online survey
- Appendix C contains a detailed set of comments received from the survey respondents
- Appendix D includes detailed tabulations of the survey results

The data collected through these surveys and the results were crucial inputs to the estimation of traffic and revenue on NTTA System facilities.

RSG also prepared a memorandum in August 2016 (included as Appendix B of this report) indicating that the values of time that were estimated for potential travelers on tolled NTTA facilities should be adjusted to reflect the changes in the CPI from 2011 dollars to 2016 dollars. In addition, income growth has outpaced inflation over this same time period, resulting in a growth in real incomes of about 9.3 percent. The overall recommendation was to adjust the values of time by 1.0098 to reflect changes in real income and 1.049 to bring the values up to 2016 dollars, for a total adjustment factor of 1.059 to adjust values of time for both sets of changes.

Section 3

Dallas-Fort Worth Area Transportation Characteristics

The purpose of this section is to provide a background of the existing and future transportation characteristics surrounding NTTA roadways in the DFW Metropolitan Area (DFWMA). To maintain consistency with regional transportation planning efforts, planned and programmed transportation improvements contained within Mobility 2040, the current Metropolitan Transportation Plan (MTP) for the DFWMA, are assumed as the regional foundation. The MTP is developed by the North Central Texas Council of Governments (NCTCOG) and adopted by the Regional Transportation Council (RTC), the metropolitan planning organization (MPO) policy body for the DFWMA. Information described in this section draws from the current MTP. As the MPO, NCTCOG is primarily responsible for conducting the multimodal long-range regional transportation planning process for the DFWMA.

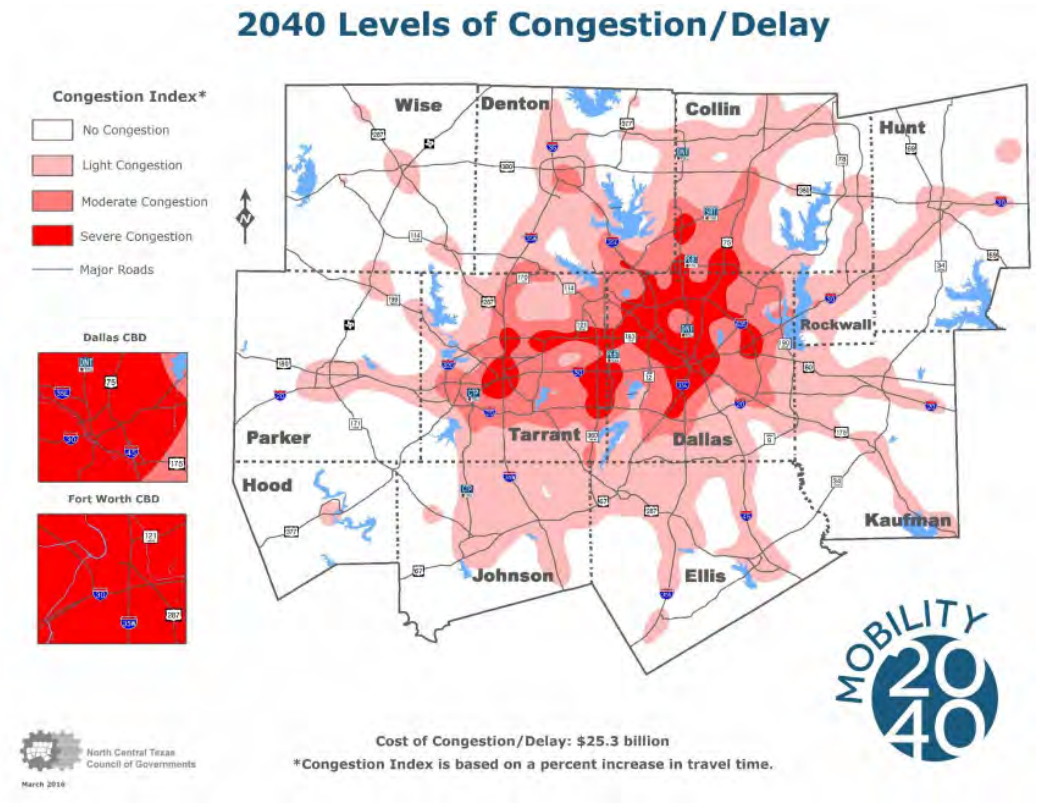
The MTP for the DFWMA serves as a guideline for the region's planned investment in the transportation infrastructure and services over the next twenty-three years. It is a federal requirement that the MTP must be financially constrained and balanced to the region's anticipated revenue streams over a minimum time horizon of twenty years. Mobility 2040 was adopted by the RTC in March 2016, and an air quality conformity determination was received from FHWA in September 2016. The Mobility 2040 plan includes $118.9 billion in major expenditures on recommended transportation improvement projects and programs expected to be implemented between now and the planning horizon year of 2040. The MTP outlines a $43.4 billion investment in North Texas roadway infrastructure expansion, system improvements, and new roadway capacity. Of that amount, $33.6 billion is designated for the construction of controlled access transportation infrastructure such as freeways, tollways and managed lanes, with the remaining $9.8 billion designated for the regional arterial system.

According to US Census, DFWMA is the fourth largest metropolitan area in the nation with population of 7.0 million in 2017 and is projected to grow to 10.7 million persons by 2040. This growth represents a 53 percent increase in the population of North Texas over a 30-year period. Total employment is expected to increase 46 percent from 4.6 million in 2017 to 6.7 million by 2040. The DFWMA has one of the largest regional economies in Texas and is larger in population than thirty-four states. Section 4 provides detailed information regarding the demographic growth characteristics of the region.

TRAFFIC CONGESTION TRENDS

Figure 3-1 provides an estimate of the 2040 congestion levels with both the currently planned transportation infrastructure and under a no-build scenario without any transportation improvements. As seen in Figure 3-1, by 2040 moderate to severe congestion will affect much of the area surrounding NTTA's roadways.

Mobility 2040 reports that the region-wide annual cost of congestion in 2017 will be close to $10.7 billion and could possibly reach $25.3 billion by 2040 with planned infrastructure improvements in place and $43.9 billion with no transportation improvements. In 2017, the region experienced peak period travel times that are more than 38 percent above free flow conditions due to congestion; and it is expected that this will increase to over 58 percent in 2040 even after implementation of all planned improvements.



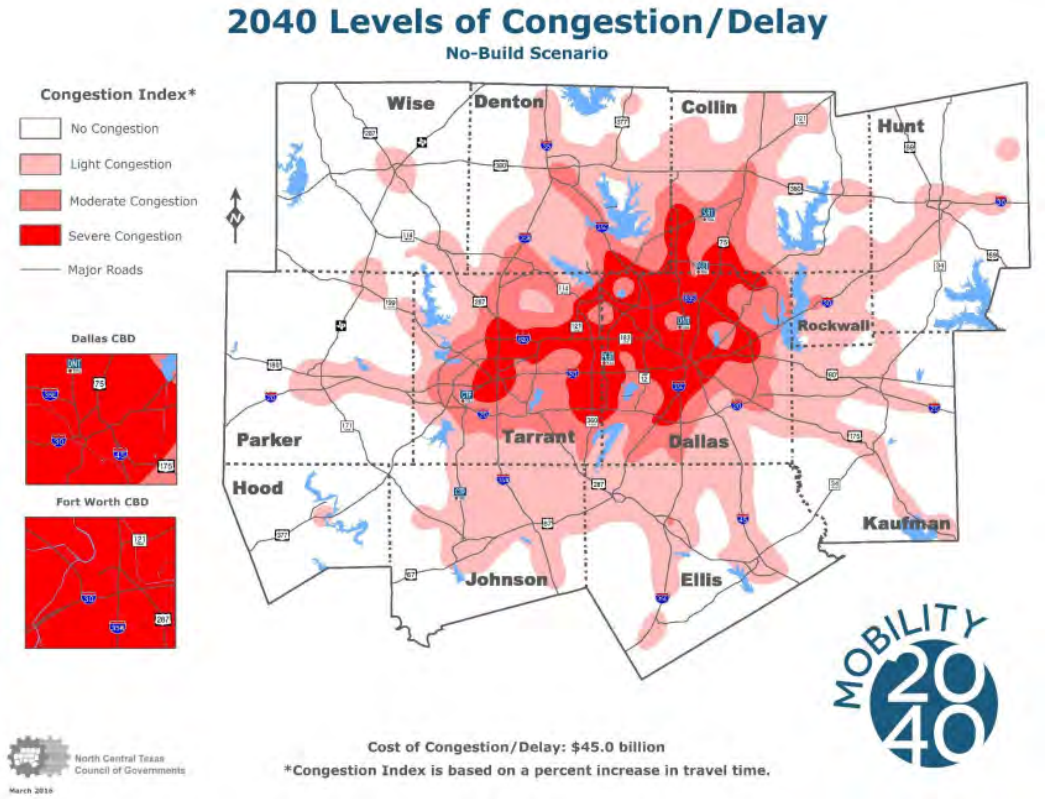


Figure 3-1.
2040 Levels of Congestion/Delay

Mobility 2040 Metropolitan Transportation Plan

FREEWAY AND TOLLWAY SYSTEM

Figure 3-2 provides an illustration of the funded roadway improvement recommendations included in the Mobility 2040 Plan, focusing on freeways, tollways, HOV/managed lanes, frontage roads and selected regionally significant arterials. The identification of these facilities is very important to this study because additional freeway and arterial improvements could materially impact NTTA System traffic and toll revenue. Facilities providing improved accessibility to NTTA System facilities could provide positive impacts to the NTTA System while competing/alternative routes could dampen its traffic and revenue potential.

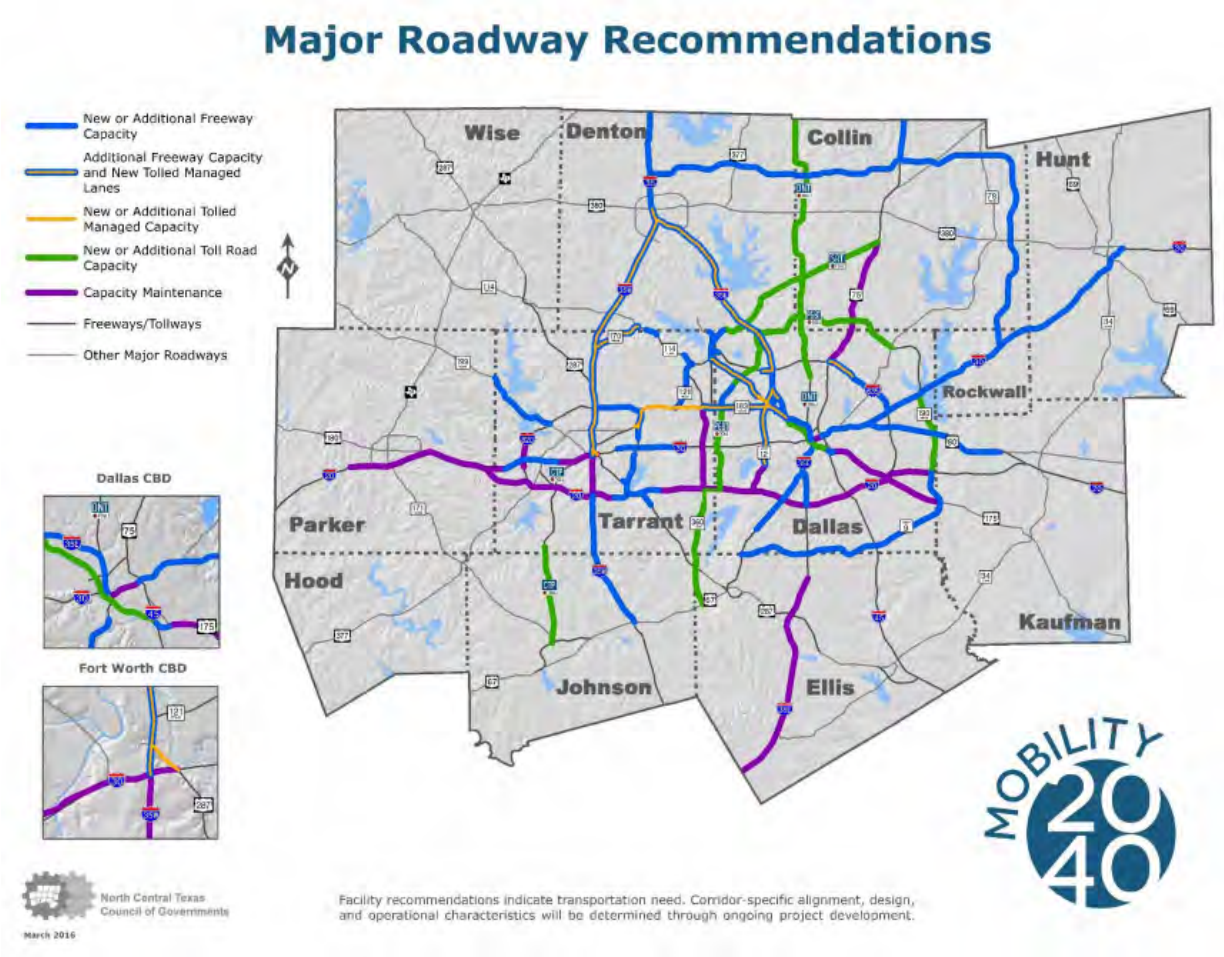

Figure 3-2.
2040 Major Roadway Recommendations
Source: North Central Texas Council of Governments
Mobility 2040 Metropolitan Transportation Plan

Additional toll roads planned for the region during the next twenty-three years include:

- SH 190 East Branch, from IH 30 to IH 20
- Trinity Parkway, from IH 35E to SH 310
- SH 360, from Green Oaks to US 287 (expected to open April 2018)
- SH 360 from US 287 to US 67

- SH 360/PGBT WE toll connector
- Dallas North Tollway Northern Extension, from US 380 to Grayson County

Additionally, the following managed lanes and associated capacity expansions are planned during the next twenty-three years in the region as shown in Figure 3-3:

- **IH 35E** – IH 35E Ultimate configuration from the IH 35E/IH 35W interchange in Denton to IH 635 in Dallas will be completed by 2027. This improvement includes expansion of general purpose lanes and managed toll lanes including conversion from current reversible managed toll lanes to concurrent managed toll lanes.
- **US 75** – The US 75 project in southern Collin County involves the reconstruction of US 75 to add general purpose freeway lanes in the section between the SRT and PGBT. This project also includes conversion of the existing HOV lanes to general purpose lanes between Spring Creek Parkway and IH 635. This project also includes interchange improvements between US 75 and PGBT aimed at alleviating significant congestion due to bottleneck conditions. These improvements will increase the connectivity from PGBT to US 75 and from US 75 to PGBT. This project is estimated to be complete by early 2019.
- **North Tarrant Express** – Segment 1 will expand general purpose lanes from four lanes to six lanes by 2027. Segment 2W will expand four managed toll lanes to six managed toll lanes by 2027. Segment 3A along IH 35W between IH 820 and IH 30 will construct new managed toll lanes by 2027 and general purpose lanes expansion by 2037. Segment 3B will expand general purpose lanes between US 81/US 287 and IH 820 by 2037. Segment 3C along IH 35W between Eagle Parkway and US 81/US 287 will include construction of the concurrent managed toll lanes and expansion of general purpose lanes by 2027.
- **IH 35W –** IH 35W South will be widened with additional general purpose lanes between IH 30 and US 67 by 2037.
- **SH 360** – SH 360 between IH 30 and IH 20 will be widened from six lanes to eight general purpose lanes by 2027.
- **Midtown Express –** The SH 183 from SH 121 to IH 35E will add two concurrent managed toll lanes by 2018. The SH 183 ultimate configuration will include additional general purpose lanes and managed lanes expansion by 2040. State Loop 12 between IH 35E and SH 183 will add two managed lanes by 2018 and the ultimate configuration will include widening of general purpose lanes and two reversible managed lanes between SH 183 and Spur 408 by 2040. SH 114 at the ultimate configuration will add general purpose lanes and concurrent managed lanes between SH 183 and SH 121.

For areas in close proximity to the NTTA System roadways, Mobility 2040 includes several changes to planned projects from what was included in prior MTPs. As shown in Figure 3-3, projects on Loop 12, IH 635 and SH 114 that were deferred in the original Mobility 2035 plan have been reestablished in Mobility 2040. Additionally, multiple projects, including SH 161, received modifications to their scope. Figure 3-4 illustrates the planned completion dates of projects in the NTTA System area that have been included in Mobility 2040. Ensuring consistency with NTTA's capital plan, additional input from the NTTA staff was utilized to modify the assumptions regarding the scope and opening dates of some of the NTTA facility expansions that are shown in Figure 3-4.

RAIL TRANSIT SYSTEM

Transit service in the DFWMA is provided primarily by Dallas Area Rapid Transit (DART), the Fort Worth Transportation Authority (The T) and the Denton County Transportation Authority (DCTA). The existing DART light-rail system consists of four lines: The Red, Blue, Green and Orange lines. The Red Line begins in South Dallas near Westmoreland Avenue and ends at the Parker Road station in Plano; the Blue Line extends from Ledbetter Drive in South Dallas to Downtown Garland; and the Green Line runs from southeast Dallas to north Carrollton. Additionally, for selected weekday trips the Orange Line runs parallel to the Red Line and a portion of the Green Line. A map of the current DART rail system is shown in Figure 3-5.

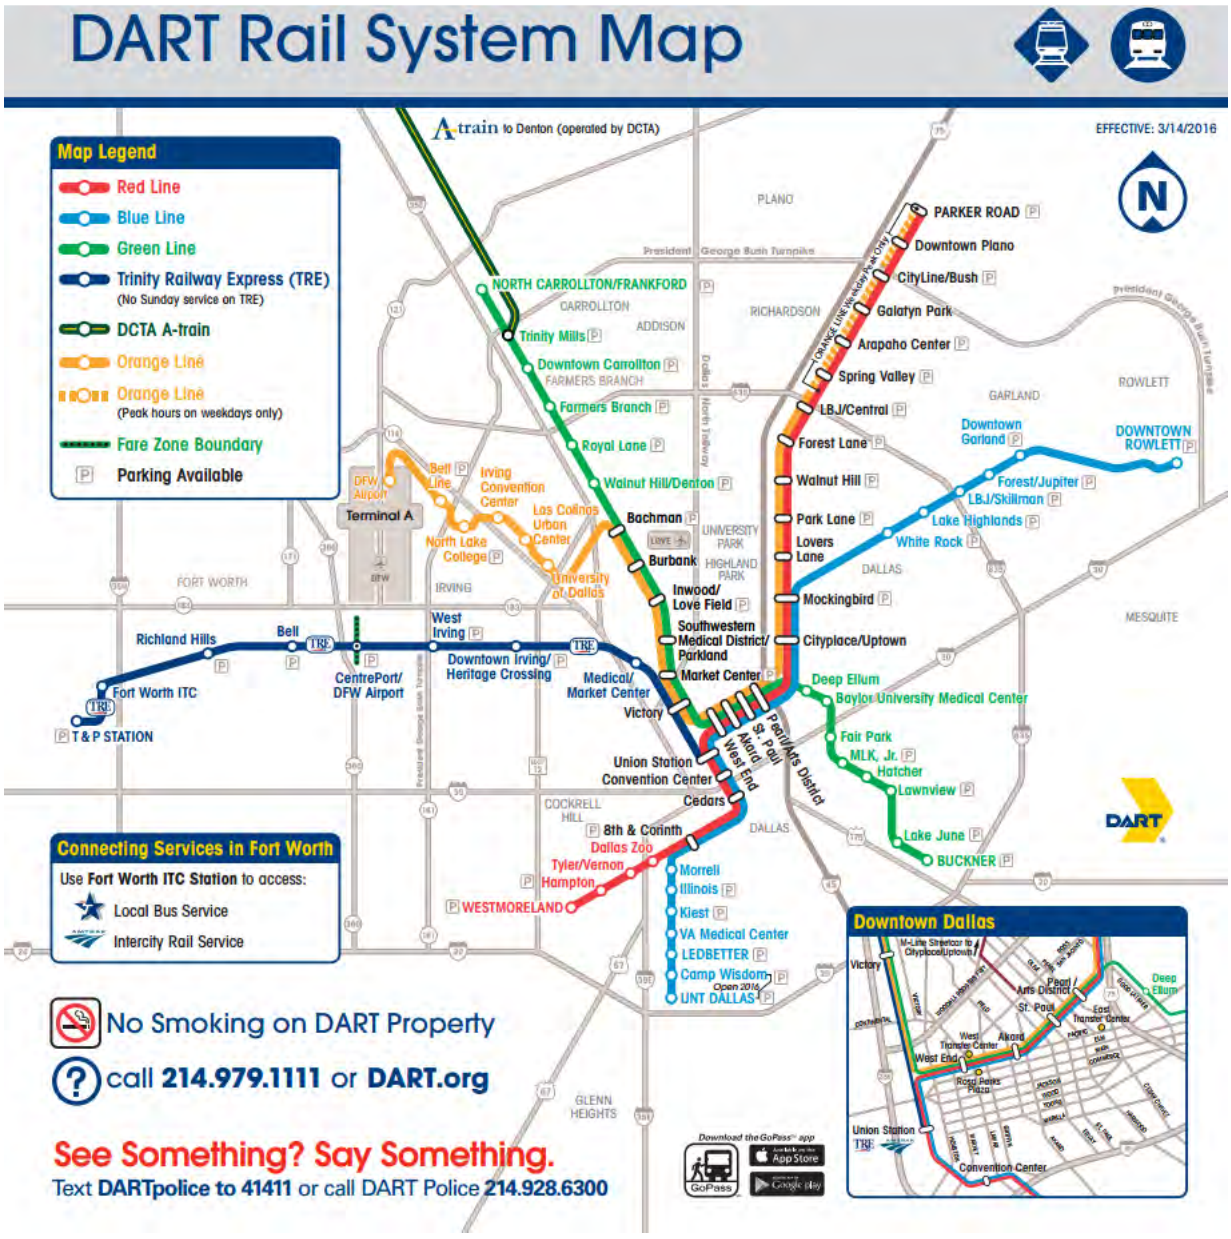

Figure 3-5.
Current DART Rail System
Source: Dallas Area Rapid Transit (http://www.dart.org)

The Fort Worth Transportation Authority is the operator of the bus system of the city of Fort Worth, popularly known as The T. The T also partners with DART on the Trinity Railway Express (TRE), which offers commuter rail service between downtown Fort Worth and downtown Dallas with "rubber tire" connections to DFW Airport.

The Denton County Transportation Authority (DCTA) is the transit authority that operates in Denton County, which is located northwest of Dallas County. Along with operating bus service in three cities within Denton County, DCTA runs the A-Train commuter rail, a regional rail line parallel to IH 35E that connects with the DART system at the Trinity Mills Station in Carrollton.

Figure 3-6 illustrates the proposed rail system as developed by NCTCOG in cooperation with the transit agencies. As can be observed in Figure 3-6, there are proposed transit alignments included in Mobility 2040 which could potentially compete directly with NTTA System facilities.

The transportation system defined in the Mobility 2040 and described above is reflected in the trip tables used to estimate the traffic and toll revenue for the NTTA System. The trip tables and networks were obtained from NCTCOG to reflect all the planned transportation infrastructure development included in Mobility 2040.

Section 4

Regional Demographic and Economic Trends

As part of this NTTA System Comprehensive Traffic and Toll Revenue Study, historical and projected demographic characteristics used by the North Central Texas Council of Governments (NCTCOG) were reviewed to develop travel demand modeling trip tables. This section describes the major socioeconomic characteristics of the Dallas-Fort Worth Metropolitan Planning Area (DFWMPA), including both regional and specific trends near the NTTA System.

In May 2015, NCTCOG's Executive Board adopted new demographic forecasts for the region. The forecasts were developed for the twelve counties that comprise the DFWMPA: Collin, Dallas, Denton, Ellis, Hood, Hunt, Johnson, Kaufman, Parker, Rockwall, Tarrant and Wise. In March 2016, the Regional Transportation Council (RTC) adopted Mobility 2040: The Metropolitan Transportation Plan for North Central Texas. The demographic datasets from Mobility 2040 were used as the baseline to generate future trip patterns in the DFWMPA. The traffic and revenue estimates included in this report utilized the databases included in the Mobility 2040 Plan.

This section first provides a description of the NCTCOG forecast process used to generate the base demographics followed by a discussion of the regional historical and future growth in the twelve-county area. This section also discusses the independent economic review, which was conducted by Research and Demographic Solutions (RDS).

The demographic information presented in this section forms the foundation used to develop the potential demand for NTTA System facilities. The demographic information is used by the trip generation model to estimate total trips for the travel demand model.

NCTCOG DEMOGRAPHIC FORECAST PROCESS

As required by federal legislation, NCTCOG periodically develops future demographics based on county and regional control totals created by the Texas State Data Center (TSDC) and other independent consultants. The TSDC is part of the State Data Center System, a national network of 52 centers (all 50 states, Puerto Rico and the Virgin Islands) in charge of disseminating demographic information. The demographics adopted by NCTCOG are considered official demographics to support the metropolitan planning process and travel demand modeling within the DFW region.

The demographic forecast and trip table development process implemented by NCTCOG is divided into six steps as illustrated in Figure 4-1. In the first step, regional control totals of population and employment were developed in five-year increments from a base year (2005) through the forecast horizon year (2040). These regional totals were obtained from the TSDC and were combined with forecasts developed by independent economists at the Perryman Group. The forecasts were developed in a coordinated effort between NCTCOG's Research and Information Services and Transportation departments.

The TSDC population forecast process is a cohort-component forecast method for which the key element is the rate of migration. Three scenarios with different rates of migration are usually developed. The 0.0 scenario assumes that there is no migration, and population change is only the result

of births and deaths. The 0.5 scenario assumes a migration rate that is fifty percent of the migration seen from 2000-2010. The 1.0 scenario assumes migration equal to that experienced from 2000-2010.

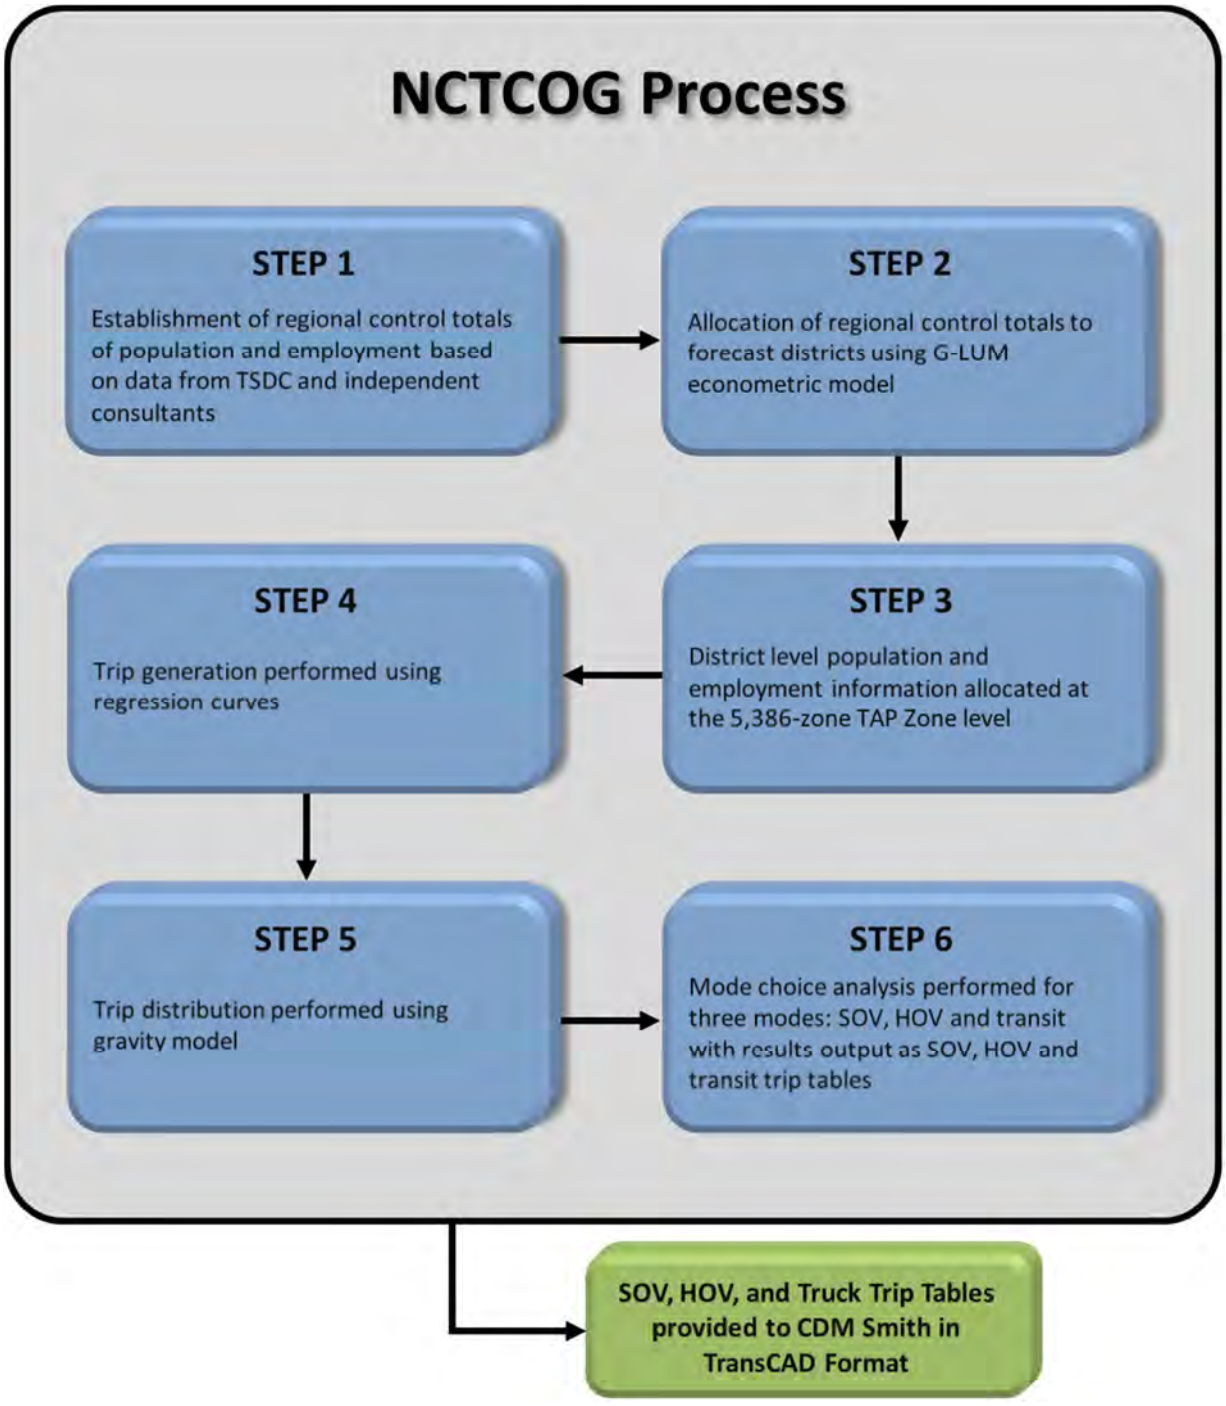

Figure 4-1.
NCTCOG Forecast Process

Table 4-1 shows the control totals that were considered during the forecasting process. The 2040 population forecast ranges from 7.7 million for the zero percent migration scenario, to 12.7 million under the 1.0 percent migration scenario. The population totals adopted by NCTCOG for the region are shown in bold in Table 4-1.

Employment control totals were generated by NCTCOG with input from their Employment Estimates program, which monitors non-construction job counts by place of work for municipalities in the DFWMPA. The employment totals seen in Table 4-1 show that the total employment of the DFWMPA is anticipated to increase from 4.0 million in 2010 to 6.7 million by 2040.

The second step in the forecasting process involves allocating the DFWMPA regional control totals to 242 forecast districts for each five-year interval. The Gravity Land Use Model (G-LUM) was used for this process. In the third step, the district level information was disaggregated to the Transportation Analysis Process (TAP) zone level using a disaggregation model developed by NCTCOG. There are 5,252 TAP zones in the DFWMPA area. The critical variables used in this process are: district level household change, acres of vacant land, density of future residential development, and proximity to transportation infrastructure. Output from this process was closely reviewed by the member cities and approved by the Regional Demographic Task Force before being presented and approved by the NCTCOG Executive Board.

The fourth step involves performing trip generation by using regression curves. This process estimates the total number of trips generated by and attracted to each Traffic Survey Zone (TSZ). In the fifth step, trip distribution is performed using the gravity model. In the sixth and final step, mode choice analysis is performed and trip tables are created for the single occupant vehicle (SOV), high occupancy vehicle (HOV), truck and transit modes. These final official tables were provided to CDM Smith by NCTCOG.

Table 4-1.Population and Employment Forecast Totals

	2010	2017	2027	2037	2040
TSDC Population Scenario 0.0	6,417,724	6,803,324	7,254,163	7,587,739	7,655,576

HISTORICAL AND FUTURE REGIONAL GROWTH

The sixteen counties served by NCTCOG include Collin, Dallas, Denton, Ellis, Erath, Hood, Hunt, Johnson, Kaufman, Navarro, Palo Pinto, Parker, Rockwall, Somervell, Tarrant and Wise. Figure 4-2 illustrates the spatial relationship of these counties and highlights the twelve counties which cover the DFWMPA travel demand model area. The analysis of historical and future demographic growth from a regional perspective is based on information pertaining to population, employment, and income for these twelve counties.

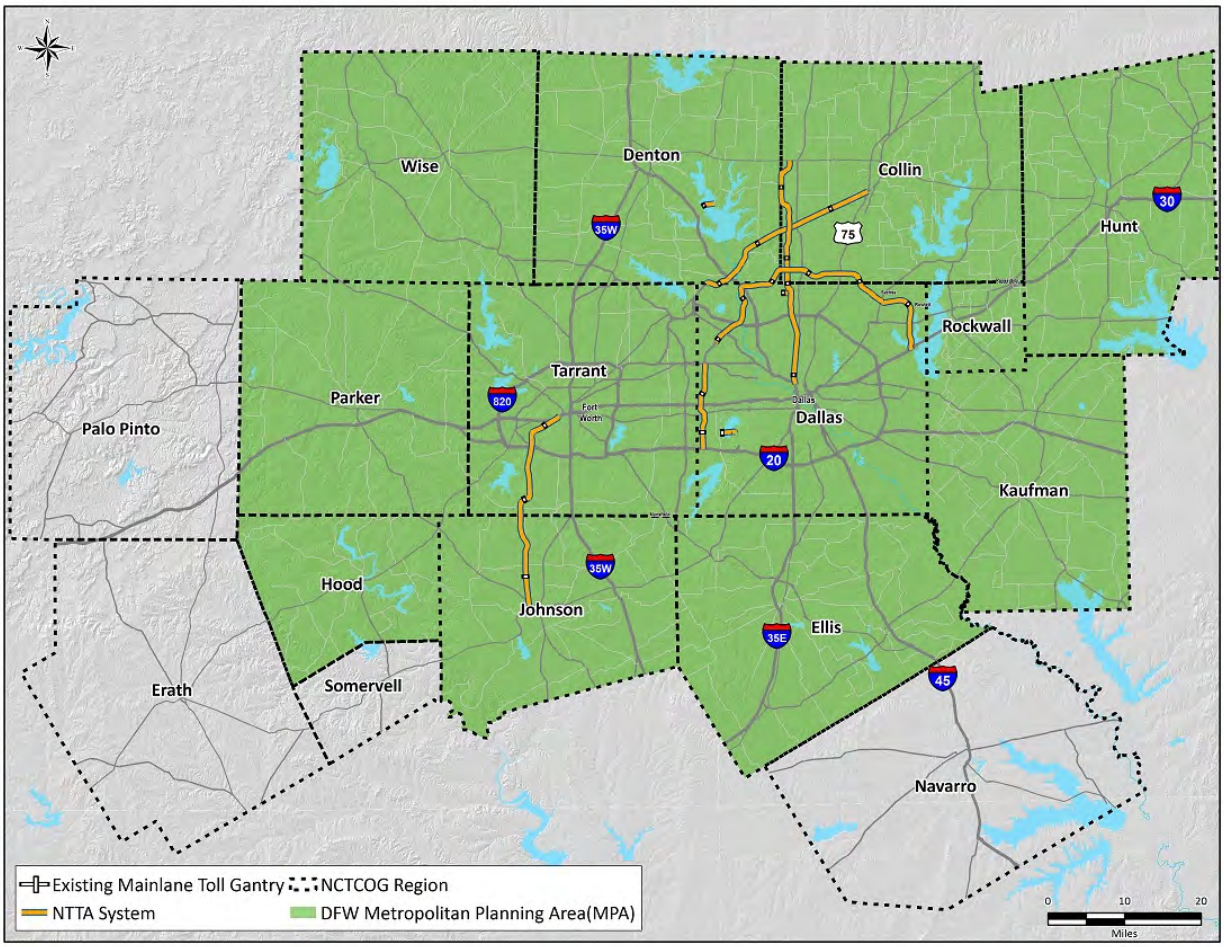

Figure 4-2.
DFW Metropolitan Planning Area

Historical Regional Population Trends

Table 4-2 shows the historical population trends for Collin, Dallas, Denton, Ellis, Hood, Hunt, Johnson, Kaufman, Parker, Rockwall, Tarrant and Wise Counties, Texas and the United States. The total population in the twelve-county area that comprises the DFWMPA has increased at an average annual rate of 2.5 percent from 1980 to 2010, resulting in 3.4 million additional residents. This regional population growth trend exceeded the state and national growth trends between 1980 and 2010 which were 1.9 percent and 1.0 percent per year, respectively.

Dallas County is the largest county in the region in terms of population with approximately 2.4 million people in 2010. Its population increased at an average annual rate of 1.4 percent between 1980 and 2010, adding a total of 811,720 people during the same period. Dallas County's population in 2010 represented approximately 36.9 percent of the total population of the twelve-county area.

Collin County and Rockwall County were the fastest growing counties in the area between 1980 and 2010. The Collin County population increased from 144,576 in 1980 to 782,341 in 2010, corresponding to an average annual growth rate of 5.8 percent over the thirty-year period. The Collin County population growth rate from 1980 to 2010 has been significantly higher than the population increase experienced by the state of Texas and the United States, respectively.

The population in Denton County increased from 143,126 in 1980 to 662,614 in 2010, corresponding to an average annual growth rate of 5.2 percent. Its growth rate was 2.7 and 5.2 times the growth rate experienced by the state and the nation, respectively, during that period. Tarrant County is the second largest county in the region in terms of population with approximately 1.8 million people in 2010. Its population increased at an average annual rate of 2.5 percent between 1980 and 2010, adding a total of 948,154 people during the same period. Rockwall County experienced a significant growth rate of 5.8 percent between 1980 and 2010, gaining 63,809 residents.

The majority of the population in the DFWMA is concentrated within the four core NTTA member counties (Collin, Dallas, Denton and Tarrant). In 2010, Collin, Dallas, Denton and Tarrant Counties contained over 87 percent of the total population of the twelve-county area, as shown in Table 4-2.

An increase in migration to the state beginning in the 1990s has helped to boost the Texas economy. Since 2006, the state has led the nation in domestic migration from states such as California and New York. According to the U.S Census Bureau, one in six people living in Texas is an immigrant. Approximately 18 percent of DFW population is foreign born. The population of the DFW region grew more than any other metropolitan area in the country between July 2013 and July 2014 according to the U.S Census Bureau. The DFW region added 127,137 people during that period.

Future Regional Population Growth

Also included in Table 4-2 is NCTCOG's population forecast from the Mobility 2040. Population in the twelve-county area is expected to increase from 6.4 million in 2010 to approximately 10.7 million by 2040, corresponding to an average annual growth rate of 1.7 percent. This annual growth rate for the twelve-county area is anticipated to be higher than the annual growth rate for both the state and the nation, which are expected to be 1.4 percent and 0.7 percent, respectively.

Dallas County's population is expected to grow by an average annual rate of 1.2 percent between 2010 and 2040, from 2.4 million in 2010 to 3.3 million by 2040. The additional 1.0 million residents expected in Dallas County by 2040 would represent the second highest number of additional residents for any county in the twelve-county area during that period. Only Tarrant County is expected to add more residents by 2040.

Collin County population is expected to grow between 2010 and 2040 at an average annual rate of 2.3 percent, from about 782,341 in 2010 to 1.6 million by 2040. Rockwall County population is expected to grow between 2010 and 2040 at an average annual rate of 2.5 percent, from 78,337 in 2010 to 166,357 by 2040.

The year 2040 population distributions for each of the counties in the twelve-county area are also presented in Table 4-2. As in 2010, Dallas and Tarrant Counties would continue to comprise the largest population centers in the twelve-county area. Most of the growth is expected to be in the core counties of Dallas, Tarrant, Collin and Denton.

Table 4-2.Countywide Population Trends and Projections

County	US Census Bureau				NCTCOG Demographic Forecast
	Year 1980	Year 1990	Year 2000	Year 2010	Year 2040
Collin	144,576	264,036	491,675	782,341	1,560,421

Historical Regional Employment Trends

Employment statistics are used as relative indicators of trip attractions to an area. Intense employment growth in an area indicates the potential for an increase in the demand for transportation infrastructure. The countywide historical employment trends in the DFWMPA are shown in Table 4-3. Between 1990 and 2010, employment in the twelve-county area increased at an annual rate of 3.2 percent, which was higher than the employment growth rate of both the state and nation. Dallas County is the most prominent employment center in the twelve-county area and is home to many industrial and medical institutions such as AT&T, Bank of America, Southwest Airlines, Texas Instruments, Baylor University Medical Center and Texas Health Presbyterian Hospital. According to figures presented by NCTCOG, Dallas County added 695,053 new jobs between 1990 and 2010 at an average annual growth rate of 2.6 percent. In 2010, jobs in Dallas County represented 48.5 percent of the total employment in the twelve-county area.

Approximately 342,261 new jobs were added to Collin County between 1990 and 2010 which corresponds to an average annual growth rate of 7.0 percent. Fourteen percent of the total jobs produced in the region from 1990 to 2010 were added to Collin County. Its employment growth rate was the highest in the DFWMA during that period. Denton County experienced strong employment growth between 1990 and 2010; employment grew from 75,817 in 1990 to 244,358 in 2010, corresponding to an additional 168,541 jobs at an average annual growth rate of 5.5 percent. Tarrant County employment increased from 586,058 in 1990 to 1.05 million, equivalent to approximately 465,469 new jobs. During 2010, the total employment in Tarrant County represented 26 percent of the total employment in the DFWMPA.

Employment distributions by county are also shown in Table 4-3. Dallas and Tarrant Counties incorporate the bulk of the employment centers in the DFWMPA, encompassing 74.7 percent of the region's total employment in 2010. Figures 4-3 and 4-4 show historical unemployment and employment growth rates for DFW and the US. As can be seen, the DFW area has been performing better than the rest of the nation in terms of unemployment rates and employment growth since 2008. In July 2017, DFW unemployment rate was 3.7 percent in comparison to the US unemployment rate of 4.6 percent.

Future Regional Employment Growth

Table 4-3 also shows the NCTCOG employment forecast for the year 2010 and 2040. Dallas County will continue to be the major employment center in the region and is expected to add an additional 1.25 million jobs by 2040. Dallas County employment is expected to increase from 1.95 million in 2010 to 3.2 million in 2040 at an annual growth rate of 1.7 percent. Dallas County is expected to house 46.7 percent of the total additional jobs in the twelve-county area.

Collin County's employment is projected to increase from 435,990 in 2010 to 762,919 in 2040 at an average annual growth rate of 1.9 percent. Collin County is expected to gain 12.2 percent of the total regional employment growth. Denton County's employment is projected to increase from 244,358 in 2010 to 445,079 in 2040 at an average annual growth rate of 2.0 percent. Denton County is expected to gain 7.5 percent of the total regional employment growth.

Employment in Tarrant County is expected to reach 1.74 million in 2040, a 0.69 million increase from the 2010 employment of 1.05 million. This represents an average annual growth of 1.7 percent between 2010 and 2040. Tarrant County is expected to account for 25.8 percent of the total additional jobs in the twelve-county area. Between 2010 and 2040, 2.67 million additional jobs are expected to be added

in the twelve-county area, at an annual average growth rate of 1.7 percent. Expected annual growth rates for employment in Texas and nation between 2010 and 2040 are 1.3 and 1.0 percent respectively. Table 4-3 also presents year 2040 employment distributions for the twelve-county area. The major employment concentrations are expected to continue to be located in Dallas and Tarrant Counties. However, the projections anticipate the migration of jobs from the major city centers to the suburban areas throughout the DFWMPA.

Table 4-3.Countywide Employment Trends and Projections

County	Historical Employment			NCTCOG Forecast
	Year 1990	Year 2000	Year 2010	Year 2040

Regional Median Household Income Trends

Travel demand, and specifically demand for toll roads, is sensitive to the amount of disposable income available within a household. A reliable indicator of a household's propensity for trip-making, and specifically a motorist's willingness to pay a toll, is median household income. Generally, households with higher incomes have a propensity to make more automobile trips than those with lower incomes due to their greater levels of disposable income. Value of time, a key factor in motorists' willingness to pay tolls, also tends to be higher in households with higher incomes.

A comparison of median household income for the twelve-county area is provided in Table 4-4. The most recent median household income data estimated by the U.S. Census Bureau for 2015 are provided for the twelve-county area, the state, and the nation. The median household income data presented in Table 4-4 indicates that when reported in real 2015 dollars, income in the region, the state and the nation grew moderately between 1989 and 2000, but had declined somewhat by 2015. The 2015 median household income in Dallas County was lower than those of the state and nation. However, several of the surrounding counties have median incomes much higher than the state and nation.

In 2000, median household incomes ranged from 1.98 times that of the state for Collin County to 0.94 times that of the entire state for Hunt County. Similarly, median income within the DFWMPA ranged from 1.84 times the national median household income for Collin County to 0.87 times the national median household income for Hunt County.

Figure 4-5 represents the median household income from the 2014 American Community Survey Five-Year Estimates at the TAP zone level for the NTTA System area presented in constant 2014 dollars. The majority of the zones with the highest median household incomes are located in Collin County and Denton County near the PGBT, SRT and north DNT corridors.

Table 4-4.Median Household Income (in Real 2015 Dollars)

County	Year 1989 [1]	Year 2000 [1]	Year 2010 [2]	Year 2015 [3]	Average Annual Growth Rate			
					(1989-2000)	(1989-2010)	(1989-2015)	(2010-2015)
Collin County	$87,349	$102,085	$86,843	$86,217	1.4%	0.0%	-0.1%	-0.1%
Dallas County	$55,640	$57,511	$51,752	$51,799	0.3%	-0.3%	-0.3%	0.0%

NTTA System - Median Household Income (in Real 2014 Dollars)

SOCIOECONOMIC INDICATORS

Major Employment Establishments

NCTCOG maintains a comprehensive list of major employment establishments in the Dallas-Fort Worth (DFW) region. There are over 300 establishments in the NTTA System area that have 500 or more full-time employees. The locations of those establishments are shown in Figure 4-6. Additionally, there are several employment locations near NTTA System corridors that have over 2,500 employees, and those locations have significant potential for generating traffic on the NTTA System. Many of these employment establishments are medical institutions including Parkland Health and Hospital System, Baylor University Medical Center, Children's Medical Center, UT Southwestern Medical Center and Texas Health Presbyterian Hospital. Other major companies located near the NTTA System include AT&T, Verizon, American Airlines, Southwest Airlines, Nebraska Furniture Mart, FedEx, JC Penney and Bank of America.

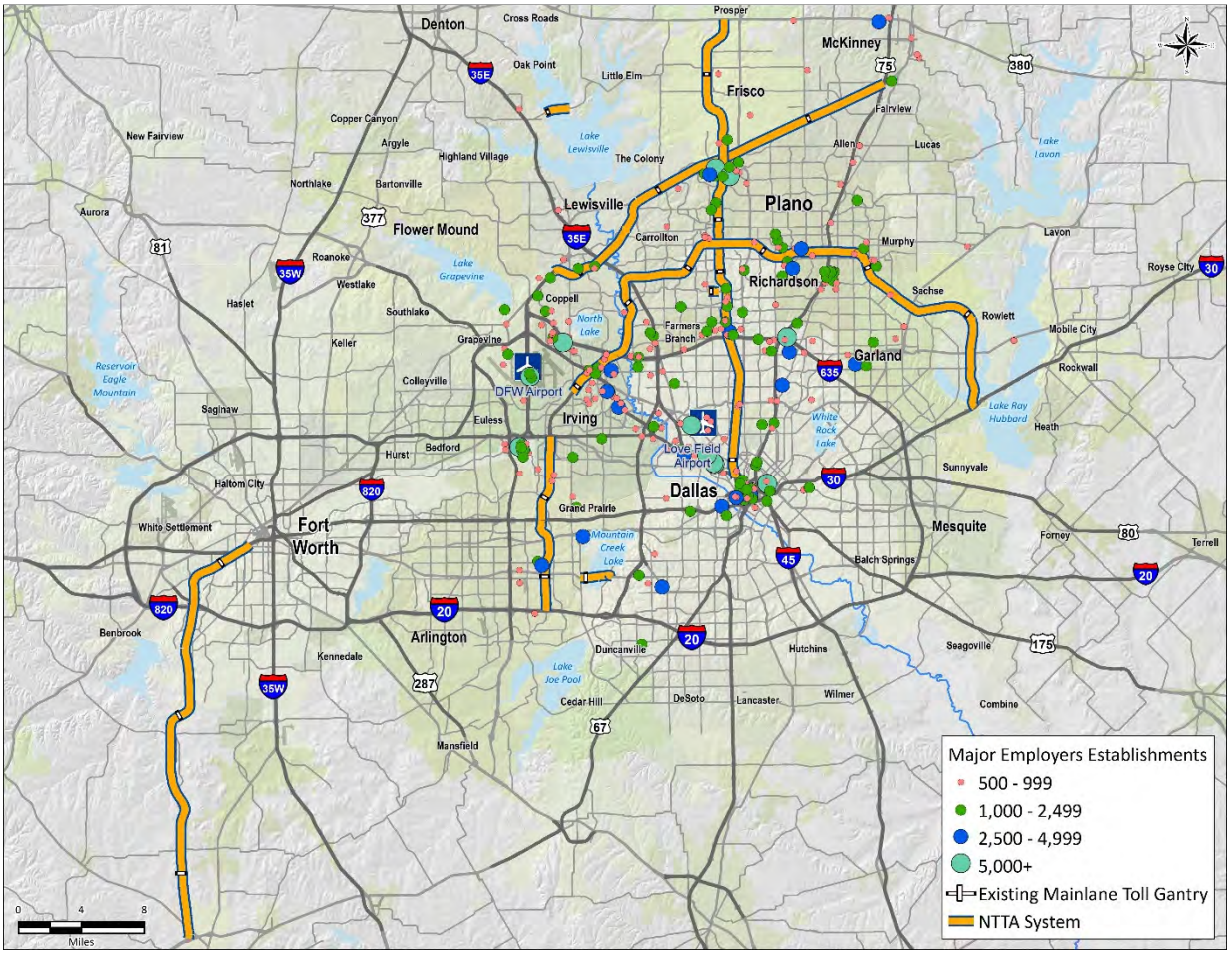

Figure 4-6.
Major Employment Establishments near NTTA System Facilities

Consumer Price Index

The consumer price index for all urban consumers (CPI-U) is the most widely used measure of inflation and serves as an economic indicator. The CPI-U determines the aggregate price level of a specific market basket of goods and services that are consumed by typical urban households. This is done by calculating the average going price of each item in the market basket. Food, clothing, housing, transportation (including tolls) and entertainment are all included in the basket. Income taxes and investment items such as stocks and bonds are not included. The Bureau of Labor and Statistics of the U.S. Department of Labor calculates the CPI-U every month.

The consumer price index for the base time frame (1982-1984) is 100. Inflation is determined by finding the percentage change in the CPI-U from one year to the next. Table 4-5 gives the historical trends for CPI-U from 1984-2017 for DFW, the Southern Region (Alabama, Arkansas, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, Washington D.C., and West Virginia), and the United States. As indicated in Table 4-5, the CPI-U in DFW has continually increased at a similar rate to the CPI-U for both the Southern Region and the United States. This indicates that the inflation rate in DFW is consistent with the rate of inflation seen nationwide. Between 1986 and 2016, the CPI-U in DFW region has grown at an average annual rate of 2.4 percent per year, which is a similar rate of growth experienced by the Southern Region and the nation during that time. Between 2006 and 2016, CPI-U grew at an average annual rate of 1.5 percent for DFW, at an annual rate of 1.8 percent for the Southern Region and at an average annual rate of 1.8 percent for the United States. It should also be noted that the CPI-U sharply increased between 2007 and 2008 and decreased between 2008 and 2009.

Trends in Building Permits

The housing industry accounts for a large percentage of investment spending. Building permits are leading economic indicators as they help predict where the economy is headed in the near future. Sustained declines in building permits slow the economy and can be indicative of a potential recession. Likewise, increases in this leading indicator can potentially indicate or trigger economic growth. The trends in single family residential building permits for the DFW region are presented in Figure 4-7. Single family building permits have generally continued to grow from year to year with some exceptions. Between 1988 and 2006, the total number of single family building permits increased at average annual rate of 6.6 percent in DFW. However, due to the recession, the number of building permits issued since 2006 has dropped significantly in DFW. Between 2006 and 2009, the number of single family building permits decreased at an average annual rate of more than 30 percent, and there has been growth in building permits since 2011.

Table 4-5.Consumer Price Index for All Urban Consumers

Year	Dallas - Fort Worth	Growth	Southern Region	Growth	United States	Growth

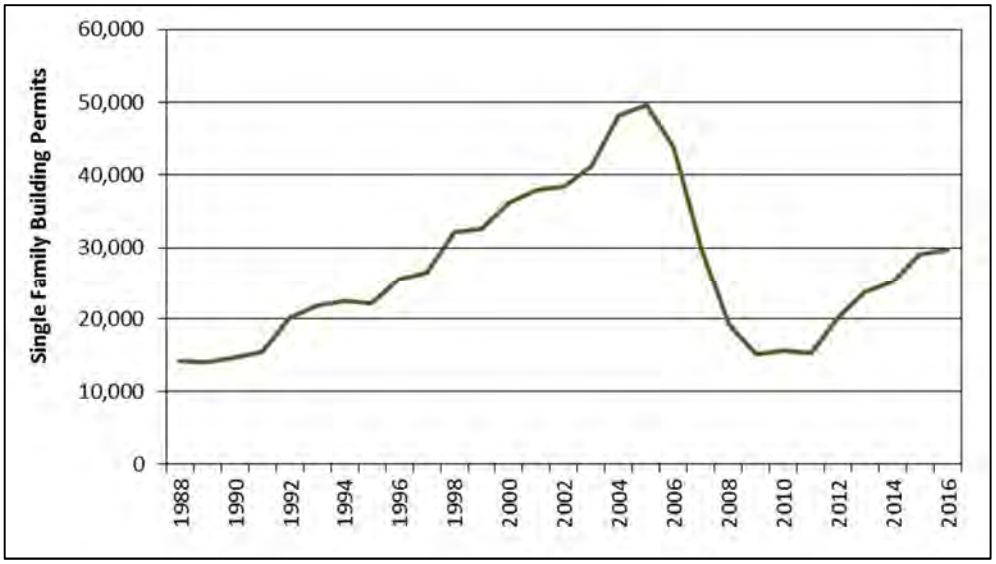

Figure 4-7.
Trends in Single Family Building Permits in Dallas-Fort Worth

Regional Home Sales

Trends in home sale prices and the number of sales can serve as a good indicator of the state of a local economy. Growth in the median sale price of area homes is presented for the Dallas multiple listing service (MLS), Collin County MLS, Denton County MLS and the state of Texas in Figure 4-8. The median price of homes sold has been steadily increasing in the DFW region and throughout the state since 2011. According to the latest Standard & Poor's Case-Shiller report, home prices in Dallas-Fort Worth have recovered more since recession than in any other U.S. market. In 2016, Dallas area home prices were eight percent higher than in 2015. Figure 4-9 shows the total number of homes sold in the Dallas Fort Worth MSA region annually since 2000. Home sales began dropping significantly in 2007 and reached a ten-year low in 2010. However, as of 2016 home sales have risen above pre-recession levels.

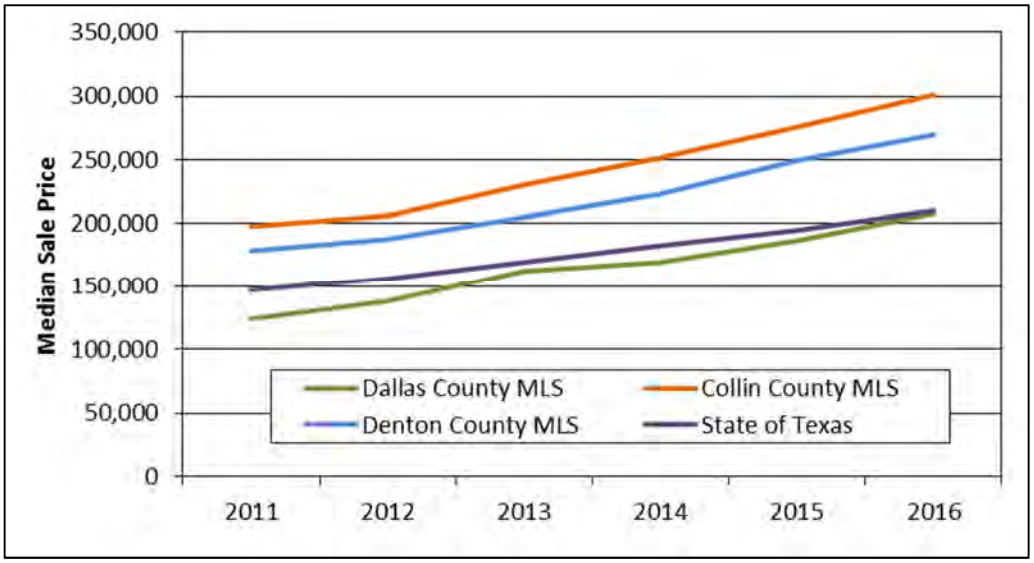

Figure 4-8.
Median Home Sale Prices

Gasoline Prices

Figure 4-10 shows the average weekly gasoline price in Texas over the past five years. Trends in gasoline prices in Texas fell sharply during the second half of 2014 and dropped below $2.00 per gallon for the first time since early 2012. Prices have remained relatively consistent since that time, and were just slightly above $2.00/gallon as of August 2017.

INDEPENDENT ECONOMIC REVIEW

The Dallas/Fort Worth area is a dynamic and rapidly growing economic region of Texas. Given the high demographic growth in the DFW region, an independent economic review was necessary for more micro level review of the demographics along NTTA System facility corridors. To get a better estimate of the future employment and population within the study area, CDM Smith engaged Research and Demographic Solutions (RDS) in 2017 to perform an independent economic review and development updates along NTTA System corridors. The findings of the economic review are included in Appendix A. The qualifier "official" refers to the NCTCOG demographics datasets, which were prepared by NCTCOG as part of Mobility 2040. The "probable" population and employment forecasts made by RDS to update the NCTCOG official demographics datasets along NTTA System corridors are referred to as the "revised" demographic datasets.

Future Population and Employment along NTTA System Corridors

The revised population and employment growth between 2017 and 2040 for the NTTA System area of influence disaggregated at the TAP zone level is highlighted in Figure 4-11 and Figure 4-12.

Population Growth Estimates

Figure 4-11 identifies the annual compounded growth rates for population in the revised demographic forecasts. Many of the zones in the NTTA System area show anticipated annual population growth rates of less than 2.5 percent between 2017 and 2040. However, although several zones are expected to generate small population growth by 2040, many of the zones with large forecasted growth in population are located directly adjacent to NTTA System facilities. As seen in Figure 4-11, there are several high population growth zones along the PGBT, DNT, SRT and CTP.

Employment Growth Estimates

Figure 4-12 identifies the annual compounded growth rates for employment in the NTTA System area. Many of the zones show anticipated annual employment growth rates of less than 2.5 percent between 2017 and 2040. Zones with higher projected employment growth are more concentrated in Collin County, Denton County, southwestern Dallas County and southern Tarrant County.

Comparison of Official and Revised Demographics

Tables 4-6 and 4-7 show a comparison of the official and revised demographics (population and total employment) projections for Collin County, Dallas County, Denton County, Rockwall County and Tarrant County for years 2017, 2027, 2037, and 2040. In 2017, the revised population estimates are higher than NCTCOG official demographics for every county except Tarrant. The revised 2040 revised population forecast is higher for Collin County, Denton County, Johnson County and Rockwall County and is lower for Dallas and Tarrant County in comparison to the official forecast. The revised employment forecast in 2040 is lower for Dallas County in comparison to the official employment forecast (see Table 4-7).

Figures 4-13 through 4-16 show a comparison of NCTCOG's official population and the revised population forecast near the NTTA System for the years 2017, 2027, 2037 and 2040. The revised population forecast is generally higher than the NCTCOG forecast through the NTTA System area, with some reasonably large increases in Collin County and Denton County. Figures 4-17 through 4-20 show a comparison of NCTCOG's official employment and the revised employment forecast near the NTTA System for the years 2017, 2027, 2037 and 2040. As shown in the figures, the revised employment is general lower than the official NCTCOG forecast across much of the study area, with the exception of some significant increases in Collin County and Denton County, many of which lie along NTTA corridors.

Section 5

Travel Demand Model Development

This section describes the travel demand model validation process, including database modifications and updates to the TransCAD network and socio-economic characteristics in the vicinity of NTTA System roadways. Figure 5-1 illustrates the travel demand process used by CDM Smith for developing the traffic and toll revenue forecasts. This methodology ensures that results are consistent with previous analyses done for NTTA by CDM Smith for toll facilities in the Dallas/Fort Worth (DFW) area.

NCTCOG INFORMATION

For this study, the latest travel demand model information was obtained from NCTCOG. This includes the latest official demographics used in the Mobility 2040 Plan. The data includes:

- NCTCOG 5,386-zone TransCAD network structure
- Highway network characteristics for the years 2017, 2027, 2037 and 2040 in TransCAD format
- Socioeconomic information at the 5,386-zone Transportation Analysis Process (TAP) level for the years 2017, 2027, 2037 and 2040
- Trip tables (zone to zone matrices) for single occupant vehicles (SOV), high-occupancy vehicles (HOV), and trucks for years 2017, 2027, 2037 and 2040. These trip tables were provided for the AM peak (6:30 to 9:00 AM), PM peak (3:00 to 6:30 PM), and off-peak (9:00 AM to 3:00 PM and 6:30 PM to 6:30 AM) periods.

HIGHWAY NETWORK UPDATE

NCTCOG's DFW highway model networks reflect the latest regional transportation improvements recommended in Mobility 2040. The networks incorporate all existing NTTA and TxDOT toll facilities and numerous other planned facilities in the DFWMA. Existing toll facilities were coded to reflect all current ramp and main lane toll charges.

The 2017, 2027, 2037 and 2040 networks provided by NCTCOG were reviewed for consistency and fine-tuned based on the travel time characteristics and traffic counts collected within the NTTA System corridors as described in Section 2. This is the model network calibration process. The calibrated networks were then used to develop the forecasted NTTA System traffic and toll revenue streams. The 2017 network was used as the base year for model validation purposes.

The travel time data collected were used to adjust the free-flow speeds along NTTA System facilities and competing/parallel roadways. These adjustments accounted for geometric and operational characteristics of the major facilities that are typically not captured or reflected as part of a regional NCTCOG validation process of travel time attributes. Some typical factors that can influence traffic flow in the corridor are intersection design constraints, traffic signal and stop sign impedances, narrow median design, and multiple entry point characteristics.

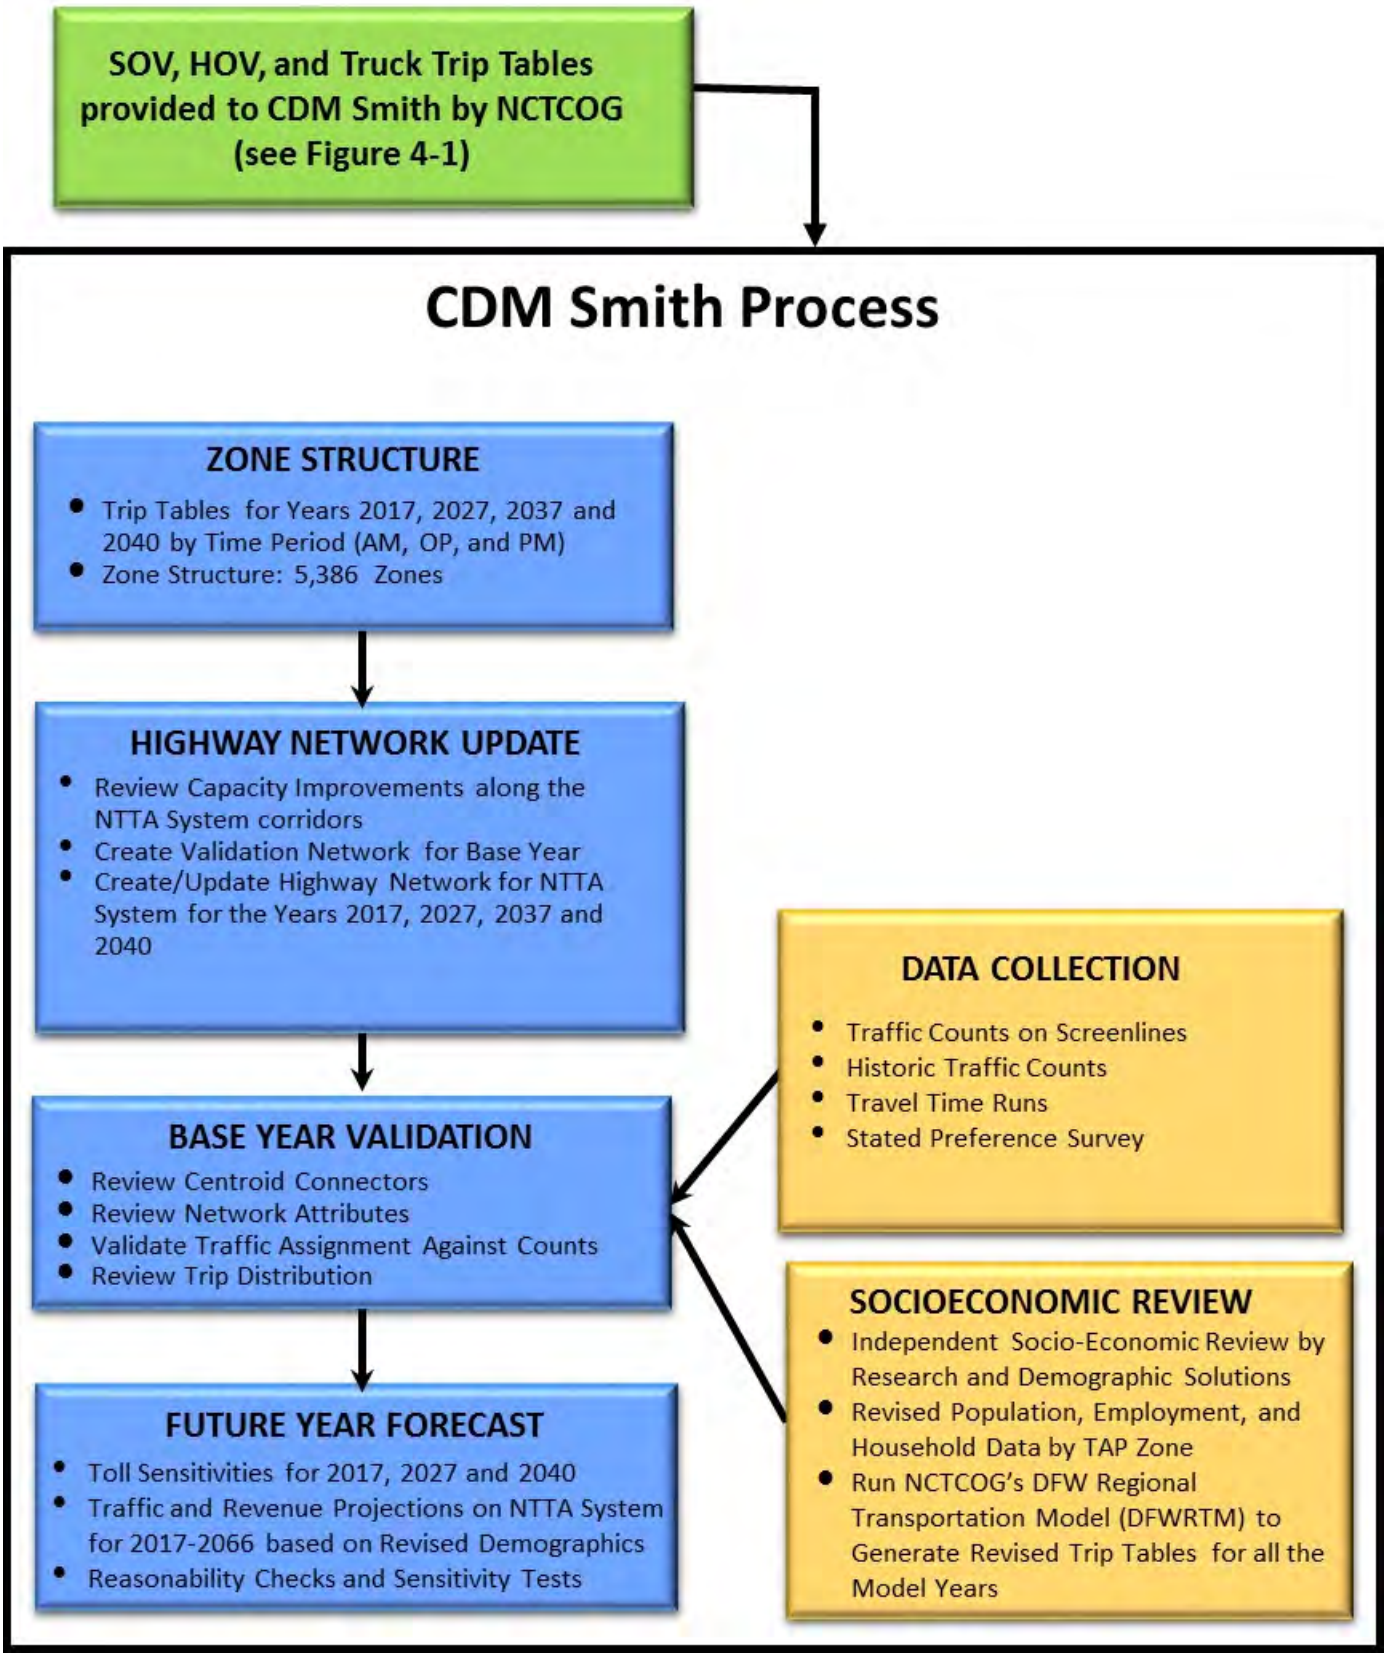

Figure 5-1.
NTTA System - Travel Demand Process

MODEL VALIDATION

The model validation process involved comparing the 2017 traffic assignment output volumes based on the revised demographics against traffic counts obtained for this study and toll transactions at all existing NTTA ramp and mainlane toll gantries. Output travel times and speeds from the travel demand model were also compared to the actual travel time information. This process was performed for each of the time periods modeled (AM peak, PM peak, and off-peak).

CDM Smith combined traffic count data collected in 2015, 2016, and 2017 with toll transaction data to validate the model and adjust the network characteristics where needed. Twenty-one screenlines were developed along the NTTA System corridors and at several strategic locations to analyze the total corridor traffic distribution and to ensure that the base model outputs reflected current traffic characteristics within those corridors. Screenlines 1 through 4 analyzed traffic in the northbound and southbound directions running parallel to the DNT at each of its four mainlane gantries. Screenlines 5 through 10 analyzed traffic corresponding to the six mainlane gantries on the PGBT. Screenlines S1 through S3 correspond to the three mainlane gantries on the SRT in addition to the two-mile existing toll-free section of SRT northeast of the IH 35E/SRT interchange. On PGBT WE, three screenlines were analyzed (W1, W2 and W3), and five screenlines across the Chisholm Trail Parkway were used for the validation effort (C1, C2, C3, C4 and C5). The locations of the twenty-one screenlines are shown in Figures 5-2 through 5-4.

As part of the validation process, trips between select origin/destination pairs included in the revised trip tables were adjusted to better reflect observed traffic counts. Table 5-1 shows a comparison of the model output volumes based on revised demographics and the daily traffic count volumes for each of the thirteen screenlines. The model output daily volumes matched closely to the traffic count volumes. Additionally, the average speeds from the model output were compared to the observed speeds collected as part of the travel time runs described in Section 2 to ensure that the model accurately reflects existing traffic conditions.

Travel demand modeling practitioners in the United States use "NCHRP 255: Highway Traffic Data for Urbanized Area Project Planning and Design," published by the Transportation Research Board to check the reasonableness of model validation. As shown in Figure 5-5, the percentage difference between the model volumes and traffic is within the acceptable range for each of the thirteen screenlines according to this widely accepted model validation standard.

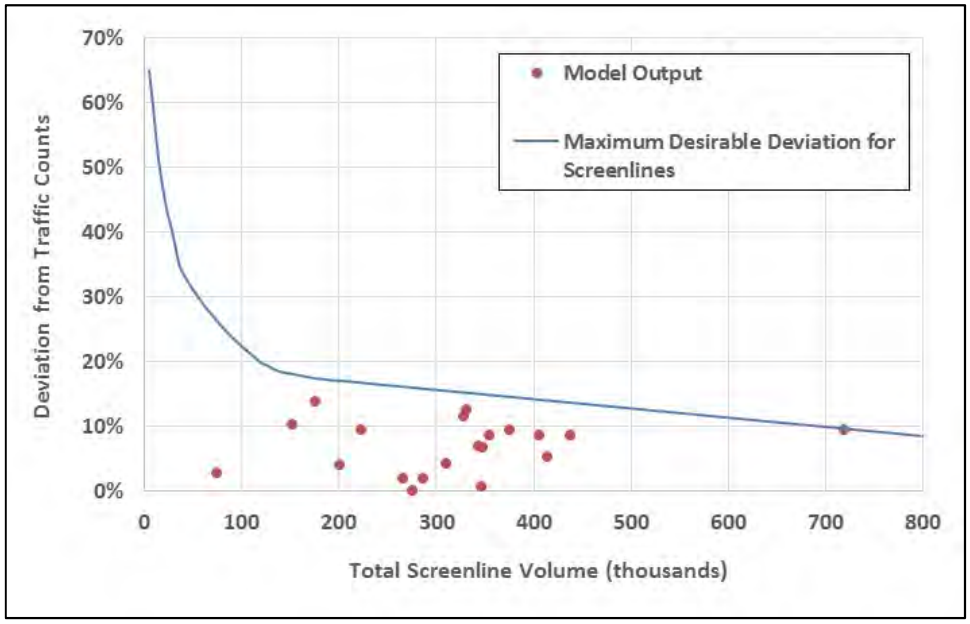

Figure 5-5.
NTTA System - Screenline Traffic Validation

MODELING METHODOLOGY

State-of-the-practice professional procedures were used in the development of the traffic and revenue forecasts for the NTTA System. The CDM Smith market share diversion routines designed specifically to emulate motorists' willingness to pay tolls at different toll levels and congestion conditions were used to test the toll sensitivities within the corridor for the years 2017, 2027 and 2040.

The toll diversion traffic assignments were run using an equilibrium diversion technique to evaluate the toll traffic potential of the NTTA System facilities. In the traffic assignment process, the travel model builds two paths between each pair of zones: one that includes toll road mainlane links and another path that excludes toll road mainlane links. The travel cost associated with using both travel paths is computed, and the volume of trips using the toll facility is then estimated based on travel time savings between the two paths. This technique simulates the driver's decision to use a toll or toll free route, which depends to a large extent on marginal differences in time and cost between the routes.

Time Cost and Vehicle Operating Costs

In addition to tolls, two other end-user costs are considered when calculating the total cost of a trip on the NTTA System: time cost and vehicle operating costs. The motorists' time cost is calculated using value of time estimates that are integrated into the modeling process. How travelers value their travel time helps them determine which route to use for a particular trip. The value of time parameter provides a measure to convert travel time into an equivalent monetary cost for inclusion in the toll diversion process. Vehicle operating costs include a multitude of additional costs to travelers such as wear and tear, maintenance, tires, oil, fuel and other variable costs.

Value of Time

The values of time used for this study were derived from the stated preference (SP) survey conducted by Resource Systems Group (RSG) as part of the October 2011 Study. The results of the survey allowed CDM Smith to calculate values of time in the NTTA System study area and surrounding counties. CDM Smith requested from RSG an assessment of current values of time in an update letter. Based on RSG's updated memo (Appendix B), 2016 VOT is recommended to be calculated by multiplying a factor of 1.059 times that of 2013 VOT. Values of time were assumed to inflate at an average annual rate of 2.25 percent between 2016 and 2020, and at a rate of 2.5 percent from 2020 onward. The average peak period and off-peak period values of time for the twelve counties in the model area are shown in Table 5-2.

Table 5-2. Value of Time by Counties (2016 $/Hour)

County	Peak	Off-Peak	County	Peak	Off-Peak
Collin	$14.17	$14.17	Johnson	$12.74	$8.89
Dallas	$13.48	$13.48	Kaufman	$13.63	$13.63
Denton	$14.00	$14.00	Parker	$14.72	$9.76
Ellis	$13.71	$13.71	Rockwall	$14.32	$14.32
Hood	$13.87	$9.20	Tarrant	$13.27	$9.91
Hunt	$13.46	$13.46	Wise	$14.37	$9.53

Vehicle Operating Costs

The vehicle operating cost used in the analysis was calculated by taking into account the average per-mile costs of gasoline and oil, and to a lesser extent on maintenance, and wear and tear of tires for vehicles in the area. It was also assumed that fuel efficiency of vehicles will improve in future years. The average fuel efficiency of passenger cars was assumed to increase from approximately 27 miles per gallon in 2011 to 52 miles per gallon in 2025 based on Corporate Average Fuel Economy (CAFÉ) standards as defined in Federal Register /Vol. 77 No. 199 (Table I-2). Beyond 2025, the fuel efficiency is assumed to improve at a slower rate. Future gasoline prices are assumed to increase to $3.00 (in 2014 dollars) by year 2020. The resulting vehicle operating costs adopted for this study are shown in Table 5-3.

Table 5-3. Vehicle Operating Costs ($/mile)

Year	Passenger Cars	Commercial Vehicles
2016	$0.16	$0.83
2020	$0.19	$1.02
2025	$0.20	$1.07
2035	$0.24	$1.25
2040	$0.26	$1.34

Revised Demographics and Trip Tables

Traffic and revenue estimates along NTTA System corridors that are presented in Section 6 of this report are based on the revised demographic datasets developed by Research and Demographic Solutions (RDS), as described in Section 4. The updated demographic datasets were used as an input to the NCTCOG DFW Regional Travel Model (DFWRTM) to generate an alternate set of trip tables and are referred to as the "revised" trip tables. These revised trip tables, with adjustments to trips applied as part of the base year validation process, were used to estimate the traffic and revenue along the NTTA System corridors.

GENERAL ASSUMPTIONS

The forecasted traffic volumes and estimated toll revenues from this study are based on the following general assumptions, which CDM Smith believes are reasonable for the purposes of this study (a more detailed description of revenue estimation assumptions can be found in Section 6):

1. By December 31, 2017, DNT's expansion to four lanes between Trinity Mills Road and PGBT in the northbound direction and between PGBT and Belt Line Road exit in the southbound direction is assumed.

2. Improvements along DNT between SRT and PGBT, including the full opening of the new Windhaven Parkway toll ramps, are assumed starting April 1, 2018. There is a ramp reversal between Windhaven and Parker Road. All Plano Parkway ramps are assumed to remain toll-free throughout the forecast period.

3. DNT Extension Phase 4A (US 380 to FM 428) is assumed to open to traffic by January 1, 2025.

4. DNT Phase 4B southbound frontage road (FM 428 to Collin/Grayson County Line) is assumed to open to traffic by December 31, 2020.

5. Expansion of PGBT from three lanes to four lanes per direction is assumed to be open to traffic December 31, 2019 between IH 35E and DNT, and between US 75 and SH 78. Expansion of PGBT from three lanes to four lanes per direction is assumed to be open to traffic December 31, 2020 in the section between Belt Line Road and IH 35E.

6. SH 161 between SH 183 and Belt Line Road is assumed to be expanded to eight lanes by July 1, 2021. From July 1, 2021 the two new lanes added in each direction on this facility are assumed to operate as toll free lanes.

7. By December 31, 2020, PGBT-WE mainlanes from north of Egyptian Way to IH 20 are expanded from two to three mainlanes in each direction. By January 1, 2031, PGBT-WE mainlanes from Conflans Road to north of Egyptian Way are restriped to four mainlanes in each direction and north of Egyptian Way to IH 20 is assumed to be expanded from three to four mainlanes in each direction.

8. PGBT/190 East Branch is assumed to open by January 1, 2027 as a toll facility.

9. Capacity improvements on SRT (Denton Creek to US 75) from three lanes to four lanes per direction are assumed from July 31, 2021.

10. It is assumed that construction required as part of the capacity improvements along the NTTA facilities over the next several years will cause minimal disruptions to traffic on NTTA facilities (with weekend or overnight closures of lanes/ramps).

11. Alignment of all NTTA System facilities is to be as described in Section 6 of this report.

12. Improvements to the present highway system in the vicinity of the NTTA System facilities are limited to those currently included in the Mobility 2040 Plan. No additional competing limited-access highways will be constructed near the NTTA System corridors at any time during the forecast period. Opening dates of the regional transportation projects are assumed to be consistent with the assumptions in the Mobility 2040 Plan, except as noted above.

13. No improvements to the DFW regional passenger rail network are assumed beyond those included in the Mobility 2040 Plan.

14. Fully electronic toll collection system, and toll collection policies and rates for the NTTA System will be adopted as shown in Section 6 of this report and toll rates are consistent with NTTA's current toll rate policy.

15. Toll rates on other regional toll roads are consistent with RTC's current toll policy.

16. In accordance with the existing practice of the NTTA, all NTTA System facilities will be well-maintained, efficiently operated, and effectively signed to encourage maximum usage.

17. Economic growth along NTTA System corridors will follow the forecasts described in Section 4.

18. Growth in vehicle operating costs (which include fuel, maintenance, and tires) will not significantly deviate from the assumed inflation rate.

19. No local, regional, or national emergency will arise which would abnormally restrict the use of motor vehicles.

THIS PAGE INTENTIONALLY LEFT BLANK

Section 6

Estimated Traffic and Revenue

This section presents the traffic and revenue (T&R) estimates for the North Texas Tollway Authority System (NTTA System) through 2066. The NTTA System facilities currently in operation are the Dallas North Tollway (DNT), President George Bush Turnpike (PGBT), President George Bush Turnpike Eastern Extension (PGBT EE), Sam Rayburn Tollway (SRT), Addison Airport Toll Tunnel (AATT), Mountain Creek Lake Bridge (MCLB), Lewisville Lake Toll Bridge (LLTB), President George Bush Turnpike (PGBT WE) and Chisholm Trail Parkway (CTP). The long-term T&R forecasts are based on the modeling methodologies and background assumptions described in Section 5 and other assumptions presented in this section. In addition, this section delineates the toll sensitivity analyses that were performed to estimate the revenue maximization toll rates and presents the results of various sensitivity tests to assess impacts on the T&R of key input variables. This section also provides estimated average weekday traffic for model years 2018 and 2040 and the resulting estimates of transactions and toll revenue through 2066.

TRAFFIC AND TOLL REVENUE ESTIMATION ASSUMPTIONS

The traffic forecasts and toll revenue estimates for NTTA System facilities are predicated on the following assumptions, which are consistent with observed trends and are considered reasonable for the purposes of this study:

Toll Rate Assumptions

DNT and PGBT

- Automatic Vehicle Identification (AVI) toll for two-axle vehicles: $0.1801/mile starting July 1, 2017 with adjustments every two years at 2.75 percent per year.
- Video toll surcharge is the maximum of, a) 50 percent of the AVI rate or b) $0.20 per transaction on July 1, 2009 inflated by 2.75 percent per year.
- Minimum toll charge is based on a trip length of 1.5 miles.
- Tolls charged to users are rounded to the next highest penny.

PGBT EE

- AVI toll for two-axle vehicles: $0.1801/mile on July 1, 2017 with adjustments every two years at 2.75 percent per year. This is the "unified toll", which is the publicly announced toll, as defined in the PGBT EE Project Agreement between NTTA and the Texas Department of Transportation (TxDOT). The ratio between the NTTA toll and the unified toll remains constant at 80 percent.
- Video toll surcharge is the maximum of, a) 50 percent of the AVI rate or b) $0.20 per transaction on July 1, 2009 inflated by 2.75 percent per year. This portion of the video toll constitutes the property and revenues of the NTTA only, and not of TxDOT.
- Minimum toll charge is based on a trip length of 1.5 miles.
- Tolls charged to users are rounded to the next highest penny.

SRT and PGBT WE

- AVI maximum base toll (MBT) for two-axle vehicles: $0.180/mile starting July 1, 2017 with adjustments every two years at 2.75 percent per year.
- Video toll surcharge is the maximum of, a) 50 percent of the AVI rate or b) $0.20 per transaction on July 1, 2009 inflated by 2.75 percent per year.
- Minimum toll charge is based on a trip length of 1.5 miles.
- Tolls charged to users are rounded to the next highest penny.
- MBT rounded to $0.001/mile.

CTP

- Automatic Vehicle Identification (AVI) toll for two-axle vehicles: $0.2298/mile (IH 30 to Altamesa) and $0.1801/mile (Altamesa to US 67) starting July 1, 2017 with adjustments every two years at 2.75 percent per year.
- Video toll surcharge is the maximum of, a) 50 percent of the AVI rate or b) $0.20 per transaction on July 1, 2009 inflated by 2.75 percent per year.
- Minimum toll charge is based on a trip length of 1.5 miles.
- Tolls charged to users are rounded to the next highest penny.

AATT and MCLB:

- AVI toll for two-axle vehicles: $0.63 starting July 1, 2017 with adjustments every two years at 2.75 percent per year.
- Video toll surcharge is 50 percent of the AVI rate.
- Tolls charged to users are rounded to the next highest penny.

LLTB:

- AVI toll for two-axle vehicles: $1.25 starting July 1, 2017 with adjustments every two years at 2.75 percent per year.
- Video toll surcharge is 50 percent of the AVI rate.
- Tolls charged to users are rounded to the next highest penny.

Truck Traffic Shares/Truck Toll Assumptions

Truck traffic (vehicles with greater than two axles) shares are applied on a gantry by gantry basis and averages assumed for each facility are shown in Table 6-1 below:

Table 6-1. Truck Shares

Facility	Truck Share (%)	Facility	Truck Share (%)
DNT	1.7	MCLB	2.2
PGBT	3.1	LLTB	3.4
SRT	3.8	PGBT WE	5.8
PGBT EE	3.2	CTP	3.1
AATT	1.0	NTTA System	3.0

Tolls for vehicles with more than two axles are calculated based on “N-1” weighting, where “N” is the number of axles. For example, the toll paid by a five-axle vehicle would be four times the toll paid by a two-axle vehicle. Average truck toll factor is a ratio of the weighted average of the truck tolls charged to

vehicles with greater than two-axles to the tolls charged to two-axle vehicles. For example, a high truck toll factor would mean a higher proportion of higher axle vehicles on a toll facility. The average truck toll factor assumed for various facilities on the NTTA System are shown in Table 6-2.

Table 6-2. Truck Toll Factor

Facility	Truck Toll Factor	Facility	Truck Toll Factor
DNT	3.02	MCLB	3.39
PGBT	3.21	LLTB	2.98
SRT	3.26	PGBT WE	3.31
PGBT EE	3.11	CTP	3.31
AATT	2.88	NTTA System	3.21

AVI/ZipCash Transaction Shares

AVI transaction shares are applied on a gantry by gantry basis and averages assumed in 2017 for each facility are shown below in Table 6-3.

Table 6-3. AVI Share

NTTA Facility	AVI Share (%)	NTTA Facility	AVI Share (%)
DNT	80.3	MCLB	60.1
PGBT	78.0	LLTB	77.7
PGBT EE	78.6	PGBT WE	70.0
SRT	80.5	CTP	78.3
AATT	78.0	NTTA System	78.6

The above AVI transaction shares also include all transactions initially recorded as ZipCash transactions that may be later identified and reclassified as AVI transactions. These transactions are called "VToll" transactions. AVI transaction shares are assumed to follow a logistic function, asymptotically increasing to an NTTA System average maximum of 85 percent.

Annual Revenue Days

"Annual revenue days" is a parameter used in the revenue estimation to convert the weekday transactions/revenue to annual transactions/revenue. Observed ratios of the weekend to weekday traffic on NTTA System facilities are used to estimate the annual revenue days. Annual revenue days are applied on a gantry by gantry basis and averages for each facility are shown below in Table 6-4.

Table 6-4. Annual Revenue Days

NTTA Facility	Annual Revenue Days	NTTA Facility	Annual Revenue Days
DNT	334	MCLB	340
PGBT	327	LLTB	340
PGBT EE	335	PGBT WE	320
SRT	339	CTP	325
AATT	309	NTTA System	333

Revenue Recovery Assumptions

The revenue recovery rate for AVI transactions/revenue was assumed to be 99.5 percent for all years. The table below describes the assumptions used for ZipCash transactions/revenue recovery. These assumptions are for ZipCash transactions and exclude VTolls, which are transactions captured by the ZipCash system whose license plate numbers are later matched to active transponder accounts. These

recovery assumptions have been developed based on guidance from the NTTA staff regarding the NTTA's goals with respect the unpursuable and uncollectable ZipCash transactions.

Table 6-5. ZipCash Assumptions

NTTA System ZipCash Assumptions (excluding VTolls)	2017
ZipCash Revenue Recovered (After 3 months)	24.0%
ZipCash Revenue Recovered (After 12 months)	36.0%
ZipCash Revenue Recovered (After 24 months)	40.0%

Traffic Growth Assumptions Beyond 2040

Between 2041 and 2045, traffic is estimated to increase at an average annual rate equivalent to that projected between 2037 and 2040. Annual traffic growth rates from 2046 onwards are shown in Table 6-6.

Table 6-6. Annual Traffic Growth Rate Assumptions (2046 Onwards)

Year	Facility/ Segment	Annual Growth Rate (%)
2046-2050	DNT Phase 3 (SRT to US 380)	1.0
	DNT (South of SRT)	0.5
	PGBT	1.0
	PGBT EE	1.0
	AATT	0.2
	MCLB	0.4
	LLTB	1.5
	SRT	1.5
	PGBT WE	1.0
	CTP	1.5
Beyond 2051	DNT Phase 3 (SRT to US 380)	1.0
	DNT (South of SRT)	0.5
	PGBT (Belt Line to DNT, US 75 to SH 78)	1.0
	PGBT (US 75 to DNT)	0.5
	PGBT EE	1.0
	AATT	0.2
	MCLB	0.4
	LLTB	1.0
	SRT	1.3
	PGBT WE	1.0
	CTP	1.0

NTTA TOLL COLLECTION CONCEPT AND TOLL STRUCTURE

As described in Section 2, the NTTA System currently utilizes a mixed toll collection system that includes AVI and video tolling (known as "ZipCash"). Under ZipCash, users without transponders are identified through the license plate number and invoiced for the toll charge incurred. The ZipCash patrons are charged more than AVI customers per transaction. A majority of the VToll transactions are charged the AVI rate, however, NTTA charges ZipCash rates for certain VToll transactions to recover the additional collection costs of VToll transactions and to discourage customer behavior related causes of VToll transactions. Tolls are collected at fixed tolling points at rates determined generally upon the influence distance using a per mile toll rate. Toll rates for ZipCash transactions are 50 percent higher than the rates for AVI transactions (with a minimum differential of $0.25 in 2017 dollars). Figures 6-1 through 6-12 show the 2017 and 2040 AVI and ZipCash rates charged at the toll gantries on all NTTA facilities.

TOLL SENSITIVITY ANALYSIS

The toll sensitivity analysis was performed to test the impacts of changes to toll rates on the transactions and revenue from each of the NTTA System facilities and the NTTA System as a whole. It is advisable that the proposed toll rates on the NTTA System facilities be less than that required to maximize revenue as determined by the toll sensitivity analysis. Future flexibility should be maintained to increase tolls, if necessary, to generate additional revenue. Future year toll sensitivity curves are based on changes in traffic characteristics along the NTTA System such as congestion levels, values of time and attractiveness of competing facilities. These curves are essential in estimating the viability of future toll rate increases. In general, the toll sensitivity curve suggests that when the toll rate increases, a portion of travelers will leave the toll facility and choose other routes. Therefore, as toll rate increases, transactions decrease. However, as the toll rate increases, the toll revenue increases until it reaches the highest revenue point where an additional toll rate increment would reduce transactions enough to result in decreased toll revenue.

Toll sensitivity analyses were conducted for the NTTA System for the years 2017, 2027 and 2040. Figures 6-13 through 6-19 illustrate the daily toll sensitivity curves for the DNT, PGBT, SRT, PGBT EE, PGBT WE, CTP and NTTA System as a whole. The curves were developed using the revised trip tables that incorporate base year calibration related adjustments, as described in Section 5, using toll rates ranging between $0.10 per mile and $0.50 per mile. The planned average two-axle vehicle AVI toll rates are included on each of the toll sensitivity curves for reference. The results indicate that the planned toll rates are below the revenue maximization points, demonstrating that, if needed, there is potential for revenue enhancement through toll increases above those assumed for traffic and revenue forecasting purposes.

ESTIMATED AVERAGE WEEKDAY TRAFFIC

An equilibrium diversion technique was used to carry out traffic assignment runs for three periods, AM peak, PM peak, and off-peak. The model runs were conducted for the years 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2027, 2031, 2037 and 2040. Traffic volumes were estimated by using the revised demographics trip tables, which were adjusted based on the base year model validation process, as described in Section 5.

As the NTTA System currently employs an AVI/ZipCash toll collection system, two separate traffic assignments, one with AVI toll charges and the other with ZipCash charges, were conducted for each model year. The traffic volumes obtained by the AVI toll charge assignment were factored by the assumed AVI transaction shares to get the AVI volumes and the traffic volumes obtained by the ZipCash toll charge assignment run were factored by the ZipCash transaction shares to get the ZipCash traffic volume. The sum of the AVI and ZipCash volumes provided the total traffic using the NTTA System. In this manner volume totals on the NTTA System facilities were estimated for each model year. All other years were interpolated or extrapolated between or beyond the modeled years to obtain the yearly traffic and revenue estimates.

The traffic assignment results at each of the analysis years were reviewed for reasonableness and post-model adjustments were made as necessary. This included adjustments to reflect model validation results along the NTTA System corridors. Figures 6-20 through 6-25 illustrate average 2018 and 2040 weekday volumes on each of the NTTA System facilities.

ESTIMATED ANNUAL NTTA SYSTEM TOLL REVENUE

Based on the traffic forecast at each toll gantry location, annual forecasts for each facility of the NTTA System were prepared through 2066. The projections extend from 2017 through 2066 and include the revenue forecasts for DNT, PGBT, AATT, MCLB, LLTB, PGBT EE, SRT, PGBT WE and CTP. In each case, forecasts for each of the facilities are based on modeled traffic estimates at each toll collection location, through the year 2040. These modeled estimates were refined, using post-model adjustments, reflecting validation factors used to match observed 2017 traffic data at each toll gantry location.

The average toll at each location was based on the current mix of passenger car and commercial vehicle traffic and the current average tolls, modified in future years to reflect changing assumptions in the proportion of AVI and ZipCash transaction shares. Toll rates for ZipCash transactions are 50 percent higher than the rates for AVI transactions (with a minimum differential of $0.25 in 2017 dollars) in each case, as noted previously.

Estimates beyond year 2040 are based on nominal assumptions regarding future traffic growth as shown in Table 6-6, with assumed toll rate increases as noted previously. As shown in Table 6-7, the estimated annual revenue on the DNT is expected to increase from $247.9 million in 2017 to $364.8 million by 2025 and $545.5 million by 2035. Revenue on the PGBT is expected to be $221.0 million in 2017, increasing to $320.6 million by 2025 and $481.7 million by 2035. Revenue on the SRT is expected to be $177.8 million in 2017, increasing to $268.0 million by 2025 and $424.4 million by 2035. As 2058 is the end of the fifty-year operational agreement of the SRT between NTTA and TxDOT, revenue from SRT is estimated through August 31, 2058, while the other facilities are assumed to generate revenue for NTTA in perpetuity. The PGBT EE toll revenue shown is the NTTA's share of the toll revenue. Under the PGBT EE project agreement with TxDOT, NTTA keeps 80 percent of the revenue generated by the PGBT EE, and the remaining 20 percent is paid to TxDOT. NTTA's share of the revenue on the PGBT EE is expected to be $36.9 million in 2017, increasing to $57.0 million by 2025 and $93.2 million by 2035. Together, the DNT, PGBT and SRT account for the majority of revenue generated by the NTTA System.

The estimated annual revenue on PGBT WE is expected to increase from $56.1 million in 2017 to $96.2 million by 2025 and $151.9 million by 2035. Revenue on the CTP is expected to be $44.9 million in 2017, increasing to $82.9 million by 2025 and $149.9 million by 2035. Revenue from the AATT, MCLB and LLTB are expected to be about $10.3 million, combined, in 2017. By 2025 this is estimated to reach a combined $15.5 million, still a very small share of total NTTA System revenue.

Total revenue on the existing NTTA System, is expected to increase from about $795.0 million in 2017 to $1.20 billion in 2025 and $1.87 billion in 2035. Driven by nominal traffic growth and continued assumed modest inflationary adjustments in toll rates, revenue on the NTTA System is expected to reach more than $3 billion per year by 2047.

Future traffic growth on the NTTA System facilities is constrained to reflect available capacity, although the widening of DNT from north of Belt Line to SRT and the widening of PGBT from six to eight lanes between SH 78 and north of Belt Line Road are assumed, and the widening of the mainlanes of SRT from six to eight lanes is also assumed.

Table 6-7. NTTA System Estimated Annual Toll Revenue (millions)

Year	DNT	PGBT	SRT	PGBT EE*	PGBT WE	CTP	AATT-MCLB-LLTB	NTTA System
2017	$247.89	$221.02	$177.85	$36.91	$56.12	$44.94	$10.31	$795.03
2018	$263.37	$230.88	$189.03	$38.75	$59.03	$50.99	$11.14	$843.19
2019	$276.56	$239.59	$198.05	$40.73	$62.95	$56.25	$11.76	$885.90
2020	$289.98	$251.12	$207.28	$43.05	$66.58	$60.17	$12.38	$930.56
2021	$303.71	$263.93	$217.19	$45.58	$73.36	$64.08	$12.95	$980.80
2022	$320.21	$277.63	$230.10	$48.27	$81.32	$68.34	$13.56	$1,039.44
2023	$334.83	$290.93	$242.15	$50.99	$86.61	$72.87	$14.19	$1,092.58
2024	$350.33	$305.21	$254.75	$53.88	$91.03	$77.76	$14.88	$1,147.84
2025	$364.82	$320.56	$268.00	$57.01	$96.22	$82.93	$15.55	$1,205.08

* - PGBT EE toll revenue shown in the Table is the NTTA's share of the toll revenue

Table 6-8 shows the projected annual transaction and revenue growth rates on the NTTA System. Annual transaction and revenue growth rates from 2017 through 2020 are equal to 2.4 percent and 5.4 percent, respectively. The transaction growth during this period captures the demographic growth, continued traffic ramp-up on PGBT WE and CTP, and the impact of capacity improvements along sections of the DNT and PGBT that are implemented in the 2018-2020 time-frame. Revenue growth during this period includes traffic growth and toll rate growth. Annual transaction and revenue growth rates from 2020 through 2030 are equal to 2.1 percent and 4.9 percent, respectively. During this period, the growth in transactions is driven mainly by the growth in the demographics along the NTTA System corridors, the assumed opening of East Branch toll road that connects to the south end of PGBT EE in 2027, the assumed opening of DNT Phase 4A in 2023 and the assumed expansion of the PGBT, SRT and PGBT-WE mainlanes in 2021.

The transaction growth rates progressively decrease to 1.5 percent between 2030 and 2040, and to 1.1 percent between 2040 and 2050. The corresponding growth rates in revenue are 4.3 percent and 4.0 percent, respectively, which incorporate the traffic growth and the assumed toll rate increases.

Table 6-8. NTTA System Transactions and Revenue Annual Growth

Period	Annual Transaction Growth (%)	Annual Revenue Growth (%)
2017-2020	2.4	5.4
2020-2030	2.1	4.9
2030-2040	1.5	4.3
2040-2050	1.1	4.0

Figure 6-26 graphically displays the annual revenue forecasts shown previously in Table 6-7 by facility. It is expected that the DNT, PGBT and SRT will continue to generate the vast majority of revenue on the NTTA System throughout the forecast period. The DNT will provide about 31 percent of all NTTA System revenue in 2018; this proportion decreases to 29 percent in 2040 as the SRT and CTP continue to mature. The PGBT (including EE and WE) will provide approximately 40 percent of all NTTA System revenue through 2040. The SRT will provide about 22 percent of all NTTA System revenue in 2018; this proportion increases to 23 percent in 2040. The AATT, MCLB, and LLTB will contribute less than two percent of revenue through 2040. This is still a relatively small share and demonstrates the importance of the DNT, PGBT, SRT and CTP to the NTTA System revenue and mobility in the region.

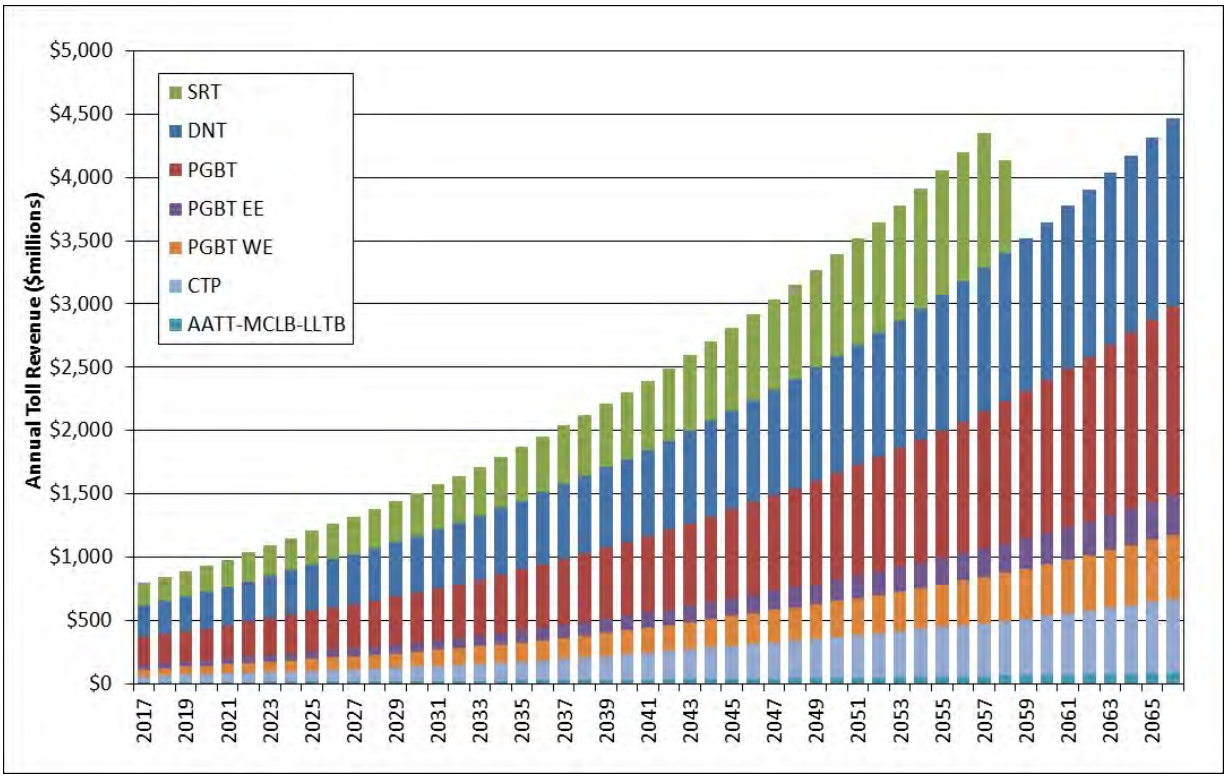

Figure 6-26.
NTTA System Estimated Annual Revenue by Facility

SENSITIVITY TESTS OF KEY INPUT VARIABLES

The base case forecasts for the NTTA System shown above are based on several assumptions, as described previously. As any forecast of the future is subject to considerable uncertainty, most traffic and revenue forecasts to be used in support of project financing typically include sensitivity tests. In general, these are intended to provide a general measure of the potential impact on the revenue forecasts associated with hypothetical changes in certain basic assumptions. These sensitivity tests provide a comparison with the previously presented base case toll revenue forecasts. Each sensitivity test is described in more detail below.

Impacts of Value of Time

Values of time (VOT) assumed to produce the traffic and revenue forecast on the NTTA System are shown in Table 5-2. Three alternative scenarios with low VOT, high VOT and VOT inflated at two percent were created to test the sensitivity of the traffic and revenue forecasts to the VOT. The first two alternative VOTs were created by assuming a 15 percent decrease and increase for the low and high VOT scenarios, respectively. The scenarios were tested for years 2017 and 2040, and the traffic forecast and revenue comparison is shown in Table 6-9.

As shown in Table 6-9, for a 15 percent decrease in VOT in year 2017, revenue is expected to decrease by approximately 6.7 percent and transactions are expected to drop by 6.2 percent. In 2040, using a 15 percent decrease in VOT, revenue is expected to drop by 5.8 percent and transactions will decrease by 5.5 percent. In 2017, using a 15 percent increase in VOT, revenue is expected to increase by 5.5 percent and transactions will increase by 5.2 percent. In 2040, using a 15 percent increase in VOT, transactions and revenue are expected to increase by 4.3 and 4.1 percent, respectively.

Table 6-9. Impacts of Value of Time

Year	Revenue			Revenue Index		
	Base VOT	0.85 VOT	1.15 VOT	Base VOT	0.85 VOT	1.15 VOT
2017	$795,034,300	$741,979,100	$839,046,400	100.0	93.3	105.5
2040	$2,301,903,000	$2,168,941,200	$2,401,268,800	100.0	94.2	104.3
Year	**Transactions**			**Transactions Index**		
	Base VOT	**0.85 VOT**	**1.15 VOT**	**Base VOT**	**0.85 VOT**	**1.15 VOT**
2017	807,526,600	757,122,100	849,335,500	100.0	93.8	105.2
2040	1,227,591,500	1,159,956,300	1,277,365,000	100.0	94.5	104.1

Impacts of Severe Demographic Growth Stagnation

Traffic and revenue forecasts were tested under severe demographic growth stagnation scenarios. Demographic growth was assumed to lag by five and ten years behind the revised demographics used in the base forecast. For each alternative, the traffic and revenue estimates were evaluated for forecast year 2040. As can be seen in Table 6-10, the five-year lag demographics/trip tables result in a revenue and transactions decrease of 8.3 percent. In the case of a ten-year lag in demographic growth, revenue in 2040 would be 14.5 percent lower, and transactions would be 14.1 percent lower.

Table 6-10. Impacts of Severe Demographic Growth Stagnation

Year	2040 Revenue		2040 Revenue Index	
	Base	Alternative	Base	Alternative
5 Year Lag in Demographics	$2,301,903,000	$2,110,534,500	100	91.7
10 Year Lag in Demographics	$2,301,903,000	$1,968,285,900	100	85.5
Year	**2040 Transactions**		**2040 Transactions Index**	
	Base	Alternative	Base	Alternative
5 Year Lag in Demographics	1,227,591,500	1,125,376,100	100	91.7
10 Year Lag in Demographics	1,227,591,500	1,053,910,300	100	85.9

Impacts of AVI Share and Revenue Recovery Assumptions

The impacts on the revenue forecasts due to the current AVI share and revenue recovery assumption changes were tested for multiple years. For this test, it was assumed that there would be no change in the total transactions. As can be seen in Table 6-11, the estimated revenue would be approximately one percent lower after 2030 if the alternate AVI share assumptions (under which the AVI share peaks at 80 percent) are used.

As shown in Table 6-12, if the ZipCash revenue recovery is assumed to be 10 percent lower than the base case in all forecast years, the revenue would be 1.2 percent lower in 2017 and 1.0 percent lower in 2040. If the ZipCash revenue recovery is assumed to be 10 percent higher than the base case in all forecast years, the revenue would be 1.2 percent higher in 2017 and 1.0 percent higher in 2040.

Table 6-11. Impacts of AVI Participation

Year	Revenue				Revenue Index	
	Base TollTag Share	Base Revenue	Alternate TollTag Share	Alternate Revenue	Base	Alternate TollTag Share
2017	**78.6%**	$795,034,300	**78.4%**	$793,723,700	100.0	99.8
2018	**79.0%**	$843,189,300	**78.6%**	$840,711,500	100.0	99.7
2019	**79.4%**	$885,895,300	**78.7%**	$882,570,500	100.0	99.6
2020	**79.7%**	$930,556,400	**78.8%**	$926,365,000	100.0	99.5
2030	**82.1%**	$1,503,965,800	**79.5%**	$1,488,687,400	100.0	99.0
2040	**83.3%**	$2,301,903,000	**79.7%**	$2,271,604,400	100.0	98.7
2050	**84.0%**	$3,394,062,300	**79.9%**	$3,343,825,800	100.0	98.5
2060	**84.4%**	$3,645,266,100	**79.9%**	$3,587,322,500	100.0	98.4
2017-2066		**$127,252,514,700**		**$125,490,188,100**		**98.6**

Table 6-12. Impacts of ZipCash Revenue Recovery

Year	Revenue			Revenue Index		
	Base ZipCash Recovery	0.9 ZipCash Recovery	1.1 ZipCash Recovery	Base ZipCash Recovery	0.9 ZipCash Recovery	1.1 ZipCash Recovery
2017	$795,034,300	$785,321,400	$804,747,400	100.0	98.8	101.2
2040	$2,301,903,000	$2,277,742,700	$2,326,063,400	100.0	99.0	101.0

Impacts of Truck Traffic Shares

The impacts of lower truck traffic shares on NTTA System revenue are shown in Table 6-13. In this test, the total number of the transactions is assumed to remain the same as the base forecast. As shown, 2017 NTTA System revenue would be 4.5 percent lower when the truck traffic share is reduced by 50 percent at all the toll gantries. In year 2040, the revenue would be 4.3 percent lower under a lower truck transaction share assumption.

Table 6-13. Impacts of Truck Traffic Shares

Year	Revenue		Revenue Index	
	Base	50% Drop in Truck Traffic Shares	Base	50% Drop in Truck Traffic Shares
2017	$795,034,300	$759,458,100	100	95.5
2040	$2,301,903,000	$2,203,108,900	100	95.7

Impacts of Revenue Days

The impacts of revenue days on NTTA System revenue are shown in Table 6-14. In this test, the number of revenue days is decreased by twelve, which translates to a reduction of ten percent in the weekend to weekday traffic ratio. As shown in Table 6-14, NTTA System revenue would be approximately 3.5 percent lower throughout the forecast period with the weekend to weekday traffic ratio reduced by 10 percent.

Table 6-14. Impacts of Revenue Days

Year	Revenue		Revenue Index	
	Base	10% Drop in Revenue Days	Base	10% Drop in Revenue Days
2020	$930,556,400	$898,298,200	100	96.5
2030	$1,503,965,800	$1,451,821,800	100	96.5
2040	$2,301,903,000	$2,222,126,200	100	96.5
2050	$3,394,062,300	$3,276,581,900	100	96.5
2060	$3,645,266,100	$3,518,061,000	100	96.5
2017-2066	$127,252,514,700	$122,849,067,300	100	96.5

NTTA System

Independent Socioeconomic Analysis

August 2017

Table of Contents

Appendices

Tables

Figures

INTRODUCTION AND PURPOSE

Research and Demographic Solutions Group (RDS) was commissioned by CDM Smith to perform an independent socioeconomic analysis concerning household, population, and employment forecasts along the North Texas Tollway Authority (NTTA) System roadways. The NTTA System is defined as eight toll roads: the Dallas North Tollway (DNT), the President George Bush Turnpike (PGBT), the Sam Rayburn Tollway (SRT), the Chisholm Trail Parkway (CTP), the Addison Airport Toll Tunnel (AATT), the Mountain Creek Lake Bridge (MCLB) and the Lewisville Lake Toll Bridge (LLTB). This report provides an independent socioeconomic analysis of selected areas in proximity of the NTTA System roadways in light of the North Central Texas Council of Government's (NCTCOG) Metropolitan Transportation Plan, "Mobility 2040", which was adopted by the Regional Transportation Council in March 2016.

RDS evaluated the latest socioeconomic forecasts (prepared by NCTCOG), for accuracy and reasonableness, detailed to the level of Traffic Analysis Process, or TAP zones. Focus was narrowed to TAP zones directly affecting portions of the NTTA System. The RDS evaluation was completed for the years of 2017, 2027, 2037, and 2040.

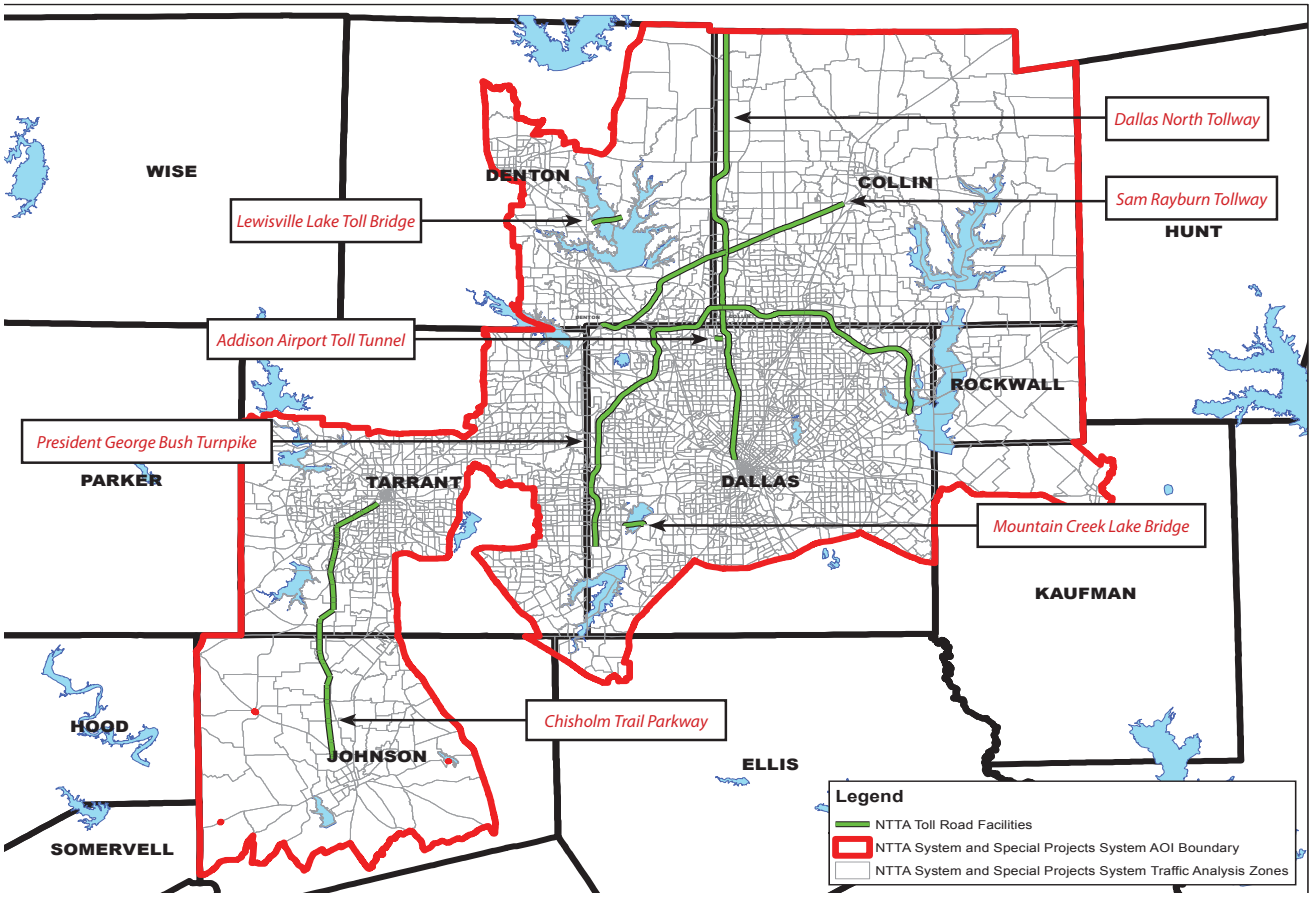
RDS also identified and calculated major emerging economic trends which directly impact the level and distribution of future socioeconomic growth in the Dallas-Fort Worth Metropolitan Statistical Area (DFW MSA). Such trends include patterns in land use, transportation improvements, and major planned developments. RDS evaluated any factors that will likely change economic growth potential or the overall distribution of economic growth. Examples include, but are not limited to future rail stations and rail line extensions, infrastructure expansions and airport development.

Full citations are provided for methodologies, sources of development trends and projections, and narratives defining and detailing important issues affecting future socioeconomic growth in proximity of the NTTA System roadways.

NTTA System Area of Interest Map

The Area of Interest (AOI) for this study includes all of Collin and Rockwall Counties, as well as portions of Dallas, Denton, Johnson, Kaufman and Tarrant Counties in proximity to the NTTA System as shown in Figure 1. CDM Smith and RDS identified 4,039 TAP zones for initial review. Criteria were then developed to help select the most active TAP zones for review.

Figure 1: Area of Interest Map

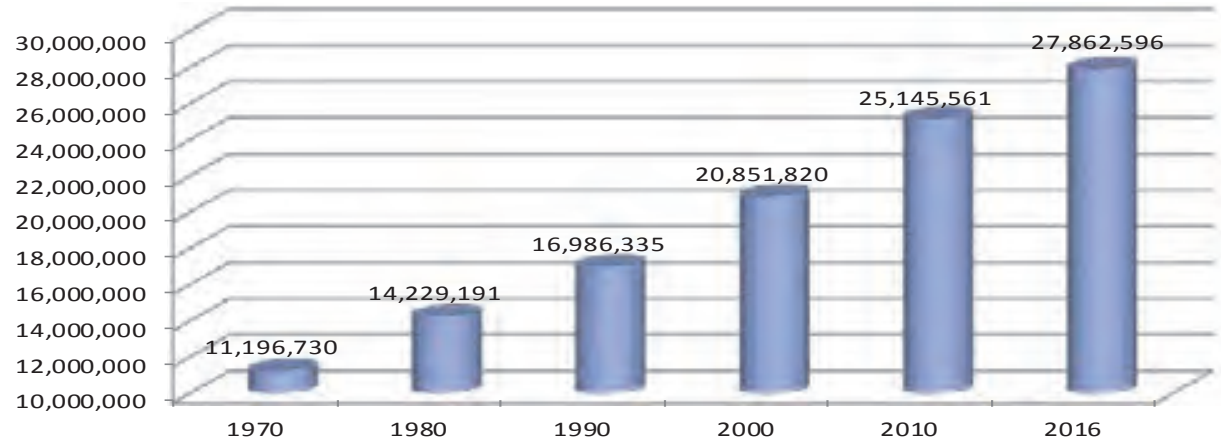


POPULATION TRENDS AND PROJECTIONS

State of Texas

Texas continues to be one of the fastest growing states in the US. After the decennial census, the Census Bureau reported that Texas added nearly 4.3 million persons between 2000 and 2010, a 20.6 percent increase in total population. Most likely, this upward curve will continue, mainly due to the state's high Hispanic migration and their accompanying birth rates.[1] As of 2016, the Hispanic population makes up over 39 percent of Texas' overall population, and has risen over 15 percent since 2010. Figure 4 shows the trends in Texas population from 1970 through 2016.

Figure 2: State of Texas Total Population 1970 - 2016



Source: US Census Bureau

Texas' population growth is expected to be strong going forward. The state's relatively low cost of living, attractive business climate, low tax rates, and diversified economy all should contribute to sizable future population gains. Depending on varying rates of migration and natural increase, the Texas State Data Center (TxSDC) estimates that anywhere from 30.3 to 45 million people will live in the state by 2040, as shown in Table 1. Though, the TxSDC recommends using the 0.5 scenario (half of migration in the 2000's) for long term planning purposes and the 2000-2010 scenario (post 2000 trends) for the short term (3-10 years).

Table 1: Texas State Population Projections (in Millions)

Scenarios	2010	2015	2020	2025	2030	2035	2040	2010-2040 Growth	Compound Annual Growth Rate 2010-2040
TxSDC 0.0 Scenario	25.1	26.2	27.3	28.2	29.0	29.7	30.3	5.2	0.63%

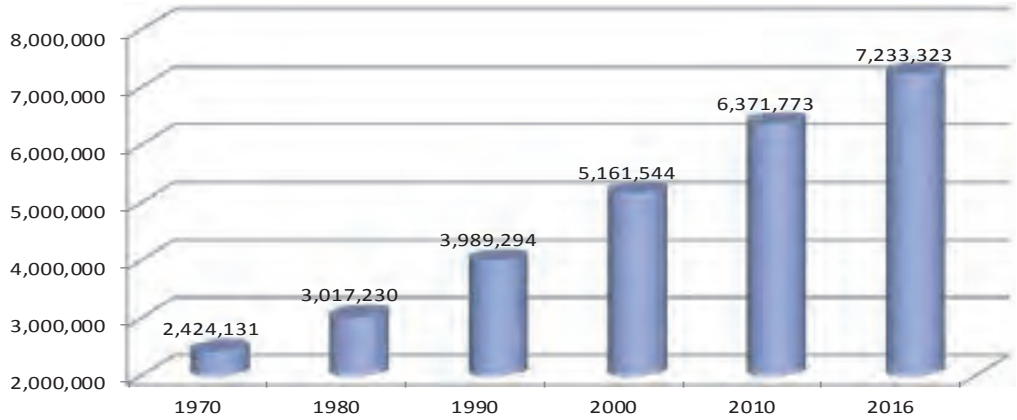
1. "Texas population tops 25 million in 2010 Census" Fort Worth Star Telegram, 21 December, 2010.

DFW Metropolitan Statistical Area

Between 2000 and 2016, the Dallas-Fort Worth-Arlington Metropolitan Statistical Area[2] (MSA) experienced the second largest regional population gain in the country and now has over 7.2 million residents, as shown in Figure 3. Overall, the MSA has added over 2 million persons in this time period. To put this in perspective, the MSA has added two entire Collin County populations from 2000 to 2016. Furthermore, the DFW MSA is averaging 22,600 more people per year from 2010-2016 than in the 2000-2010 period.

Figure 3: Dallas-Fort Worth-Arlington MSA Population 1970 - 2016



Source: US Census Bureau

Even though residential construction has slowed in many areas of the country, all forecasting agencies including the NCTCOG, the Texas State Data Center, Woods & Poole, and the Texas Water Development Board agree that the region will continue to see very strong household and population growth through 2040. There are a myriad of attributes that contribute to the overall regional projections. These include a recent history of strong growth, affordable and available land with no limiting geographic boundaries such as an ocean or foreign border, the relatively low cost of doing business in the state and region, central geographic location in the U.S., favorable weather and amenities, etc.

Historical Population Trends

Table 2 shows the historical populations of Dallas, Tarrant, Collin, Denton, Rockwall, Ellis, and Johnson Counties during the past 56 years. Collectively, the population of these seven counties grew from 1.7 million residents in 1960 to more than 6.7 million residents during 2016. Almost two-thirds of that population growth occurred in Dallas and Tarrant Counties. However, Collin County experienced the most rapid rate of growth with a CAGR of 5.74 percent between 1960 and 2016, from 41,247 to 939,585 residents. The CAGR's of Denton and Rockwall Counties increased by over 5 percent, respectively, during this same period. The population in the region's southern suburban counties grew more slowly, with Ellis County growing by 2.5 percent and Johnson County increasing by 2.8.

2. The DFWA MSA is comprised of Collin, Dallas, Delta, Denton, Ellis, Hunt, Johnson, Kaufman, Parker, Rockwall, Tarrant and Wise Counties.

Recent Population Trends

Table 3 shows the populations of the ten largest metropolitan statistical areas (MSAs) in the United States. The largest MSAs in the United States during the U.S. Census Bureau's 2016 population estimates were the New York-Newark-Jersey City, NY MSA (20.2 million residents), the Los Angeles-Long Beach-Anaheim, CA MSA (13.3 million residents), and the Chicago-Naperville-Elgin, IL MSA (9.5 million residents). The Dallas-Fort Worth-Arlington, TX MSA (hereafter referred to as the Dallas-Fort Worth MSA) was ranked as the fourth largest MSA in the United States during the 2010 Census and in the U.S. Census Bureau's 2016 population estimates. During 2016, the estimated population of the Dallas-Fort Worth MSA was 7.2 million residents, which was an increase of over 2 million new residents since the 2000 decennial U.S. Census.

On an average annualized basis, the Dallas-Fort Worth MSA grew by approximately 127,000 residents each year between 2000 and 2016, which was slightly less growth than the Houston-The Woodlands-Sugar Land, TX MSA's 130,000 per year. The Houston MSA, which was the only other Texas MSA ranked among the ten largest in the United States, had a population of almost 6.77 million residents during 2016. When ordered by total population change between the 2000 decennial U.S. Census and the U.S. Census Bureau's 2016 population estimates, the Houston MSA was estimated to have had the largest overall population growth of 2.08 million (see Table 4). The Dallas-Ft. Worth MSA was the second fastest growing population with 2.03 million new residents, followed by the Atlanta-Sandy Springs-Roswell, GA MSA with 1.53 million new residents. Though not on the Top 10 list, the 12th largest MSA in the US, Phoenix-Mesa-Scottsdale, AZ has added 1.4 million new residents from 2000 to 2016 making it the fourth MSA in total growth.

Source: U.S. Census Bureau, 2010 and 2016

Table 5 provides population counts from the 2000 and 2010 decennial U.S. Censuses, as well as the U.S. Census Bureau's 2016 population estimates. These data show that the population of counties in the DFW region grew strongly between 2000 and 2016. The most population growth occurred in Tarrant County, with an estimated 567,582 new residents since 2000. Collin County also grew robustly during this same period increasing by 448,313 new residents. However, since the 2010 U.S. Census, the compounded rate of population growth has slowed in all of the counties, with the exception of Dallas County. Dallas County's population growth accelerated from a CAGR of 0.66 percent between 2000 and 2010 to an estimated CAGR of 1.42 percent between 2010 and 2016. Rockwall County's population growth, on the other hand, slowed dramatically from a 6.17 percent CAGR between 2000 and 2010 to 3.08 percent from 2010 to 2016.

Table 5: Recent Population Trends for Select Counties in the Dallas-Fort Worth MSA, 2000-2016

	TOTAL POPULATION			TOTAL CHANGE	AVERAGE ANNUAL CHANGE		CAGR	
COUNTY	2000	2010	2016	2000 to 2016	2000 to 2010	2010 to 2016	2000 to 2010	2010 to 2016

Source: U.S. Census Bureau, 2010 and 2016

Table 6 shows a comparison of the population growth in the northern and southern suburban counties between 2000 and 2016. Dallas and Tarrant Counties are considered the core urban counties of the region, while Collin, Denton, Rockwall, Ellis, and Johnson are considered suburban counties. During this 16-year period, the population in the northern suburban counties of Collin, Denton, and Rockwall was estimated to have increased by 872,383 residents compared to 93,736 new residents in the southern counties of Ellis and Johnson. In addition to the total growth of the northern counties' population being over nine times greater than the southern counties', the CAGR of the northern counties was also more than twice the CAGR of the southern.

Table 6: Comparison of Recent Population Growth in Northern and Southern Suburban Counties

COUNTY	TOTAL POPULATION			TOTAL CHANGE	CAGR

Population Projections

Table 7 shows the three most recent population projection scenarios from the Texas State Data Center (SDC) for the Dallas-Fort Worth MSA. The projected population for the Dallas-Fort Worth MSA is expected to be between 7.6 million and 12.7 million residents in 2040. The most conservative scenario, the 0.0 migration scenario, assumes that there will be no net migration and the population will grow solely based upon the number of births and deaths in the region. The 0.5 migration scenario assumes that future net migration will be one-half the rate that occurred between the 2000 and 2010 decennial U.S. Censuses. The 1.0 migration scenario assumes that future net migration will be equal to the net migration rate between 2000 and 2010. The historical growth rate of the population for the Dallas-Fort Worth MSA implies that the region's population will likely grow at a rate between the 0.5 and 1.0 migration scenarios.

Table 7: Population Projections for the Dallas-Fort Worth MSA, 2010-2040

Total Population

Year	0.0 Migration Scenario	0.5 Migration Scenario	1.0 Migration Scenario

Source: Texas State Data Center, 2014

Table 8 illustrates the SDC's population projections for seven counties in the Dallas-Fort Worth MSA. Assuming historical net migration trends continue (i.e. the 1.0 migration scenario), Dallas County's future primacy as the most populous county in the region could be challenged by the year 2050, as the populations of Collin, Denton and Tarrant Counties could all potentially grow to 3 million or more residents.

Note: Table 8 only provides population projections for 7 of the 12 counties in the Dallas-Fort Worth MSA.
Source: Texas State Data Center, 2014

Table 9 compares the Texas SDC's population projections for the northern suburban counties to the southern suburban counties. Depending upon the migration scenario, the population of the northern counties in 2040 will be between 5 and 7.5 times the population of the southern counties. At the higher end of the projection scenarios (i.e. the 1.0 migration scenario), the population of the three northern counties would be approximately 4.8 million residents versus almost 650,000 in the southern counties.

NTTA System City-Level Population Trends

Many cities in the NTTA System AOI have seen tremendous growth over the past forty-six years, but the "second ring" suburbs have seen the fastest growth over the last ten. Overall, the City of Dallas saw the most absolute growth by adding about 473,000 residents from 1970 to 2016. Fort Worth's population boom since 2000 saw it grow 460,000 persons- 69 percent of this growth from 2000 to 2016. over the same timeframe. Plano, one of the nation's fastest growing suburbs between 1970 and 2000, grew by over 200,000, but slowed to a 1.6 percent growth rate over the past sixteen years. Collin County's second and third largest cities, Frisco and McKinney, have added over 118,000 people since 2000 while two of the county's smaller towns, Prosper and Celina, have seen their populations grow annually by 14 percent and 10 percent respectively.

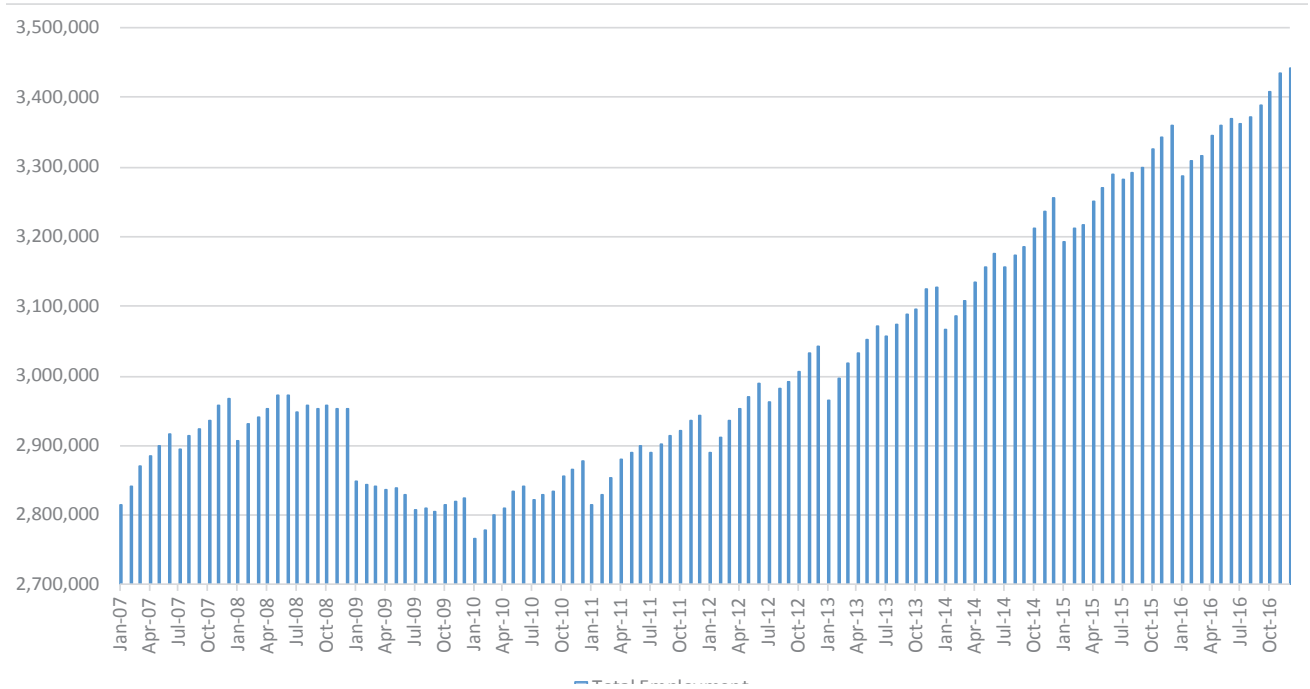
EMPLOYMENT TRENDS AND PROJECTIONS

Regional and County

In the past, a downturn in the oil industry meant a downturn in the Dallas-Fort Worth job market. Recently, the diversity of the region's economy has helped it weather these downturns due to well-represented job strength in the service industries - specifically professional and business services, education and health services and leisure and hospitality. Prior to the region's steady employment growth, the workforce in the Dallas-Fort Worth MSA fared comparatively well during the 2008-2009 national recession. While there were substantial job losses, those losses have been replaced with new jobs and the local economy had more workers at the end of 2012 than it did before the recession began. This accomplishment eluded the national economy. Figure 4 shows the total employment in the Dallas-Fort Worth MSA between 2007 and 2016 based upon the Texas Workforce Commission's Quarterly Census of Employment and Wages (QCEW) data. The overall trend for the region has been positive, although not consistently so. The region had approximately 2.80 million jobs during January 2007, growing to a peak of 2.97 million jobs during May 2008. After that point, the region's employment began to slowly decline with a sharp contraction occurring in December 2008. During that month, employment in the Dallas-Fort Worth MSA dropped by more than 100,000 jobs. While a decline in the number of workers between December and January is typical, since it is a period of seasonal employment, the lack of recovery during subsequent months demonstrates that these job cuts were indeed permanent. The region's total employment fell to its lowest level during January 2010, when it reached 2.75 million jobs. Since then, barring seasonal fluctuations, total employment has steadily risen in the Dallas-Fort Worth MSA topping out in December 2016 at 3.44 million jobs.

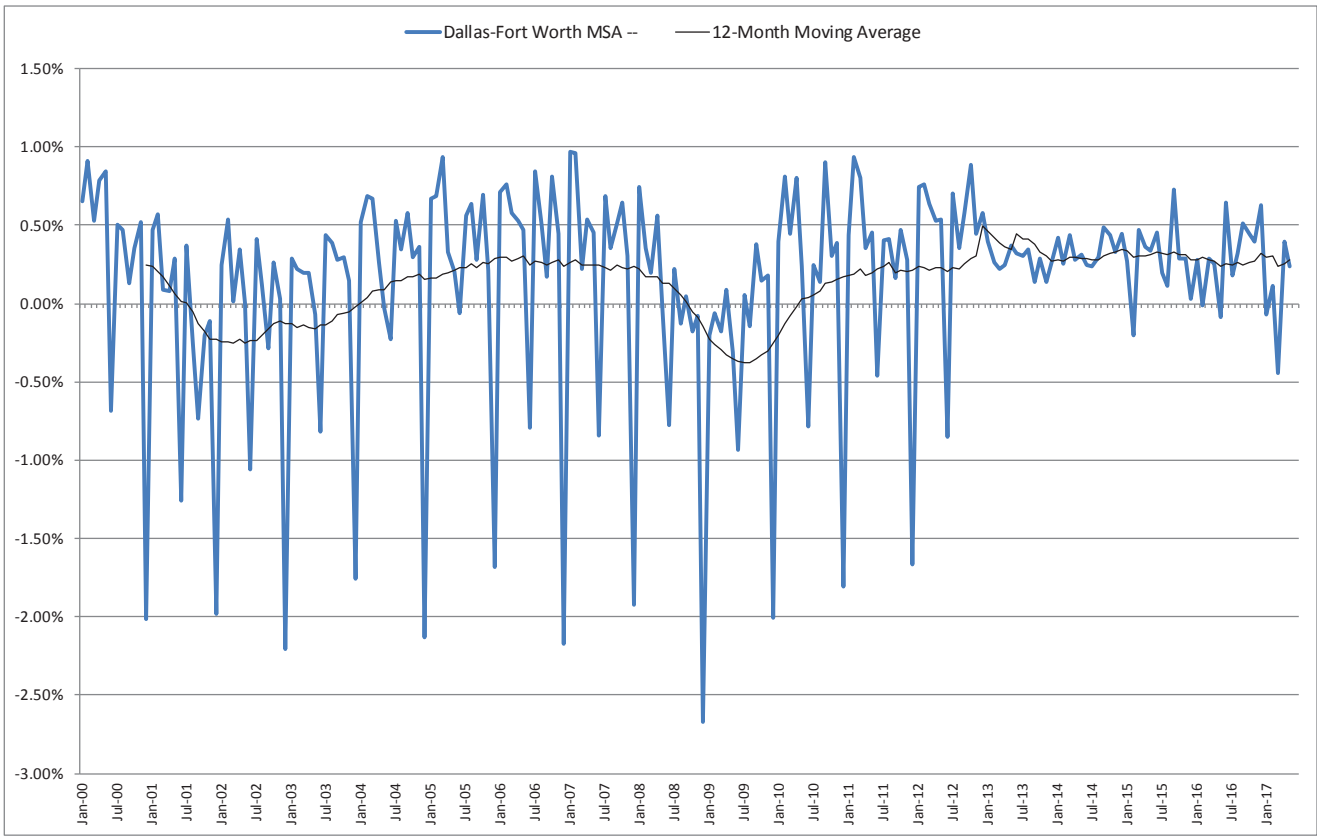
Figure 4: Total Employment in the Dallas-Fort Worth MSA, 2007-2016



Note: Figure based upon Quarterly Census of Employment and Wages (QCEW) data.
Source: Texas Workforce Commission, 2016

Figure 5 shows a longer period of employment data using the Texas Workforce Commission's Current Employment Estimates (CES) data. The CES data differ from the QCEW data, since they are based upon surveys of employers rather than the actual count of employees, as the QCEW data are. Nonetheless, the discrepancies between the actual and estimated employment numbers tend to be relatively consistent, so the CES data can provide a reasonable surrogate for understanding employment trends when longer term QCEW data are not available. The data in Figure 5 show the percentage month-on-month employment change between January 2000 and June 2017. The unadjusted employment change shows considerable volatility, due to seasonal and academic employment. However, by adding a trend line showing the 12-month moving average, this volatility can be smoothed and the trends can be discerned. The 12-month moving average trend line shows that the Dallas-Fort Worth region suffered a prolonged period of job loss between 2001 and 2003, due to the downturn in the computer and telecommunications industries, in addition to the recessionary effects of the September 11, 2001 terrorist attacks. The region's economy recovered by early 2004 and enjoyed a period of sustained employment growth until 2008, when the national recession took hold. Although the job loss of the 2008-2009 Recession occurred over a briefer period than the previous recession, the job losses were steeper. Since mid-2010, the Dallas-Fort Worth MSA has experienced another sustained period of employment growth similar to the mid-2000s.

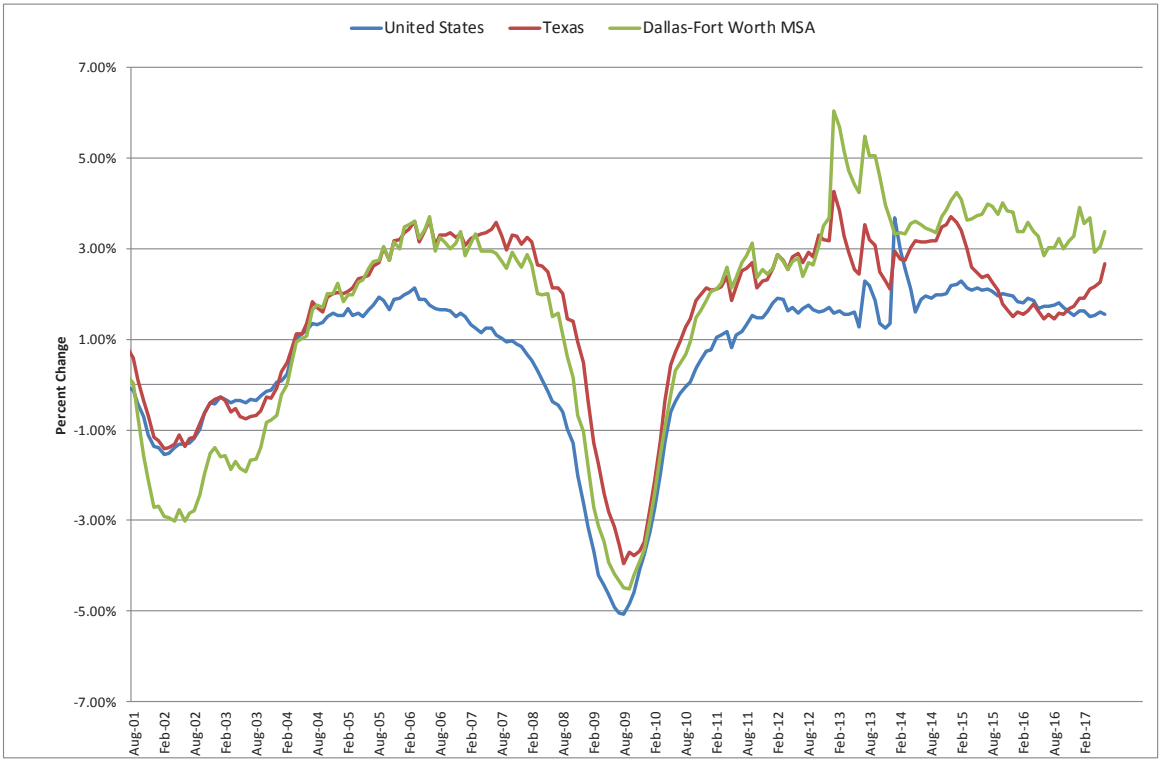
Figure 5: Month-on-Month Employment Change for Dallas-Fort Worth MSA, January 2000 to June 2017



Note: Figure based upon Current Employment Statistics (CES) data.
Source: Texas Workforce Commission, 2017

Figure 6 shows the year-on-year employment change for the United States, Texas, and the Dallas-Fort Worth MSA. These data show that the recession which began in 2001 had a more significant effect on the Dallas-Fort Worth region, than it did on the United States or Texas. After recovering, the region's employment grew more quickly through the mid-2000s than it did in the nation overall, with a rate of growth that was very similar to Texas' overall rate. In fact, employment change in the Dallas-Fort Worth region has outperformed the overall rate for the United States through June 2017, even during periods when total employment was contracting. Although it did not de-couple from the Texas economy, the region underperformed against the Texas economy, starting in early 2007, and continued to do so until early 2011. More recently, the Dallas-Fort Worth MSA has been consistently outperforming Texas since November 2012.

Figure 6: Year-on-Year Employment Change for the United States, Texas, and the Dallas-Fort Worth MSA, January 2001 to February 2017



Note: Figure based upon Current Employment Statistics (CES) data.

Source: Texas Workforce Commission, 2017

Table 11 shows more detailed employment data for the four largest MSAs in Texas during the period between 2007 through 2016. The data show that the Dallas-Fort Worth MSA had a net employment increase of 532,133 jobs between 2007 and 2016 which was the highest overall job growth of the four MSA's. However, when compared against the other three largest MSAs in the state, the Dallas-Fort Worth MSA has the second-slowest CAGR at 1.88 percent. The Houston MSA had the second largest overall job growth among the MSA's with 395,204 new jobs between 2007 and 2016, but the Austin MSA had the highest CAGR at 2.91 percent, adding 221,522 new jobs. Thus, while the Dallas-Fort Worth region has had very robust population growth, its rate of employment growth during the period between 2007 and 2016 lagged other regions of the state.

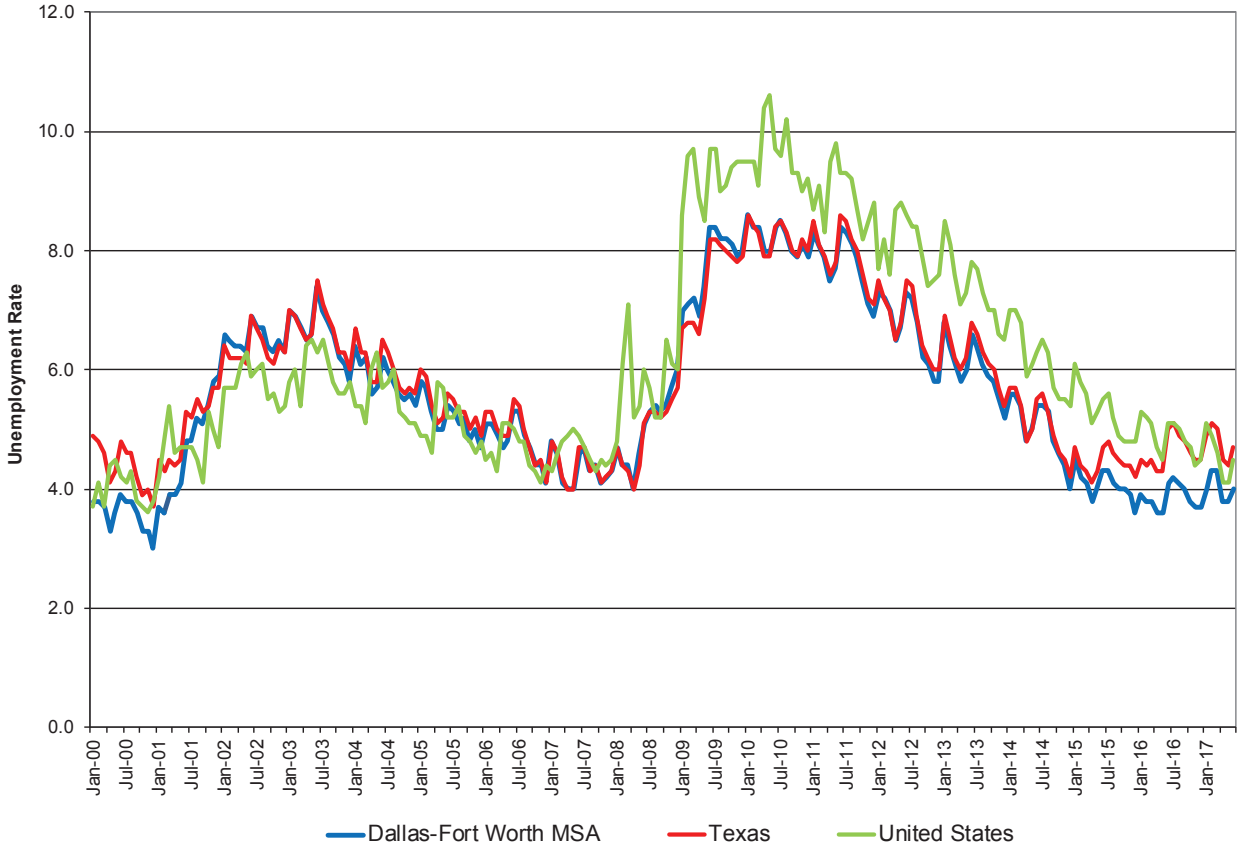
Unemployment

Figure 7 shows the unemployment rates for the United States, Texas, and the Dallas-Fort Worth MSA. These data show the unemployment rate in the region has closely tracked the overall unemployment rate in Texas during most of the period between January 2000 and June 2017. The Dallas-Fort Worth MSA experienced its lowest unemployment rate during December 2000, when it fell to 3.0 percent. During the recession that began in 2001, the regional unemployment rate peaked at 7.5 percent in June 2003. As the regional and national economy recovered and employment expanded during the mid-2000s, the regional unemployment rate fell to approximately 4.0 percent before increasing rapidly during 2008 and 2009. During the 2008-2009 Recession, the regional unemployment rate reached 8.5 percent in June 2009 and sustained that general level for the next two years. From 2011 to 2017, the regional unemployment rate has followed a downward trend until December 2014, and since it has hovered close to 4 percent .

Figure 7: Unemployment Rate of Dallas-Fort Worth MSA, Texas, and the United States, January 2000 to June 2017



Note: The unemployment rate data in Figure 7 are based upon seasonally unadjusted unemployment rates. The unadjusted figures were used to maintain consistency between the three geographies of the United States, Texas, and the Dallas Fort-Worth MSA. While seasonally adjusted data are available from the Texas Workforce Commission for the United States and Texas, they are not available for Texas's MSAs.

REAL ESTATE TRENDS

Relocations of over 75 company headquarters since 2010 has spurred an strong growth in both residential and commercial construction throughout the Dallas-Fort Worth region. Domestic and international investment in DFW remains strong and will likely assure supply increases in almost all facets of the real estate markets for some time to come. Like almost every metropolitan area in the United States, the 2008-2009 Recession had a profound impact on the regional housing market, as well as commercial real estate. The near collapse of the nation's financial system and the severe curtailment of demand due to the subsequent recession led to a sharp reduction in the number of new single-family homes built after 2006. Multifamily construction was also severely impacted by the recession, although it later benefitted because fewer households were able to secure the financing to purchase new homes. Similarly, all aspects of commercial real estate were affected by the recession, either due to tight credit markets or financially stressed tenants. Fortunately, the nation's commercial real estate market did not experience the same collapse as the residential market (a real and significant threat at the time) and it has been showing a continuing positive movement over the past seven years.

Residential Trends

Figure 8 shows the U.S. Census Bureau's single-family building permit data from Real Estate Center at Texas A&M University, which reports the number of monthly single-family building permits issued in the Dallas-Fort Worth-Arlington MSA, based upon 2013 U.S. Census MSA boundaries. In this 29-year time frame, historical single family building permit activity in the Metroplex showed relatively steady growth after the stock market crash in 1988 until the housing bubble burst in Fall of 2006. After bottoming out in January 2009, the region has seen - barring a few seasonal hiccups - steady, sustained growth up to the most recent June 2017 MSA totals. Since November 2014, the MSA's single family permits issued have averaged more than 80 per day. Low interest rates, job growth, pent-up demand and low supply will likely result in the region's single family construction rates continue to climb in the foreseeable future.

Figure 9 illustrates the number of single-family building permits issued in Collin, Dallas, Denton and Tarrant Counties. The data show that building permit activity was especially robust in Tarrant County through 2006, reaching almost 2,000 permits during October 2005, then dropped sharply thereafter to less than 500 single-family permits per month through April 2013. Denton County, on the other hand, was a less active market throughout this period and the number of single-family building permits issued actually began declining during 2002. Overall, monthly building permit activity during 2012 and early 2013 was lower than that in early 2000. Since January 2013, all counties have experienced a significant upswing in residential construction. In 2017, the monthly average for the four counties averaged 2,500 permits, up from 2,120 in 2016.

Figure 8: Single-Family Building Permits Issued in Dallas and Fort Worth-Arlington MSAs

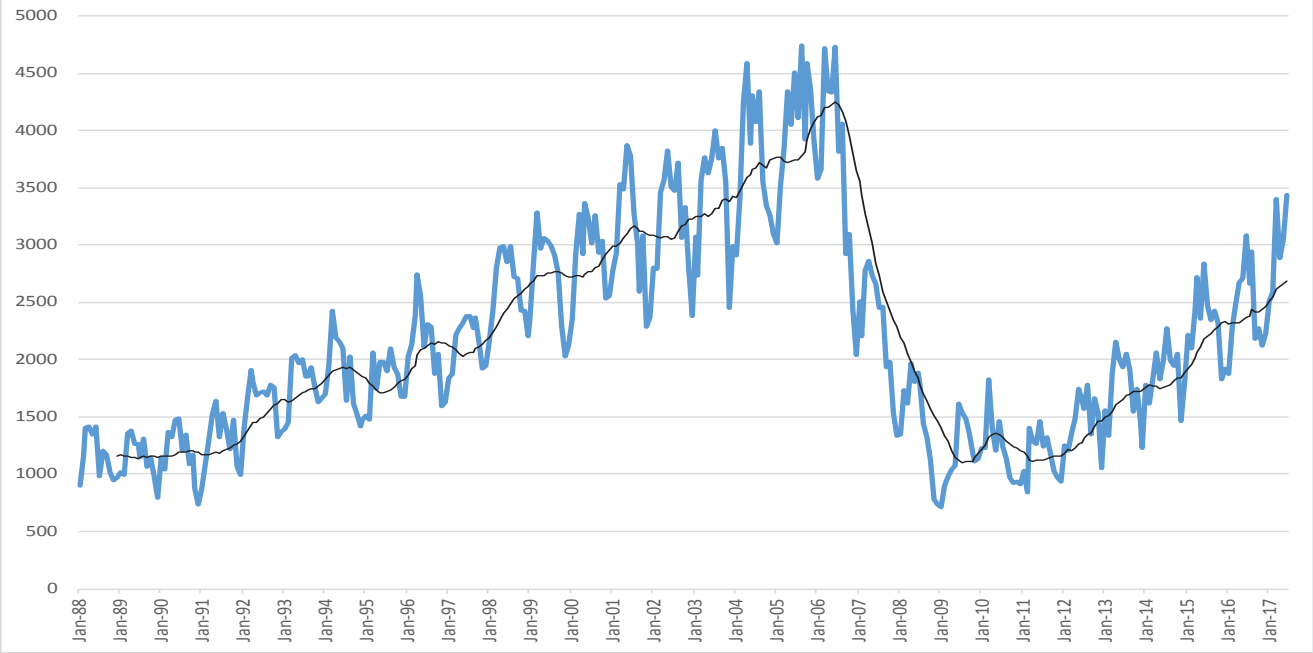

Figure 9: Single-Family Building Permits Issued in Dallas, Tarrant, Collin and Denton Counties
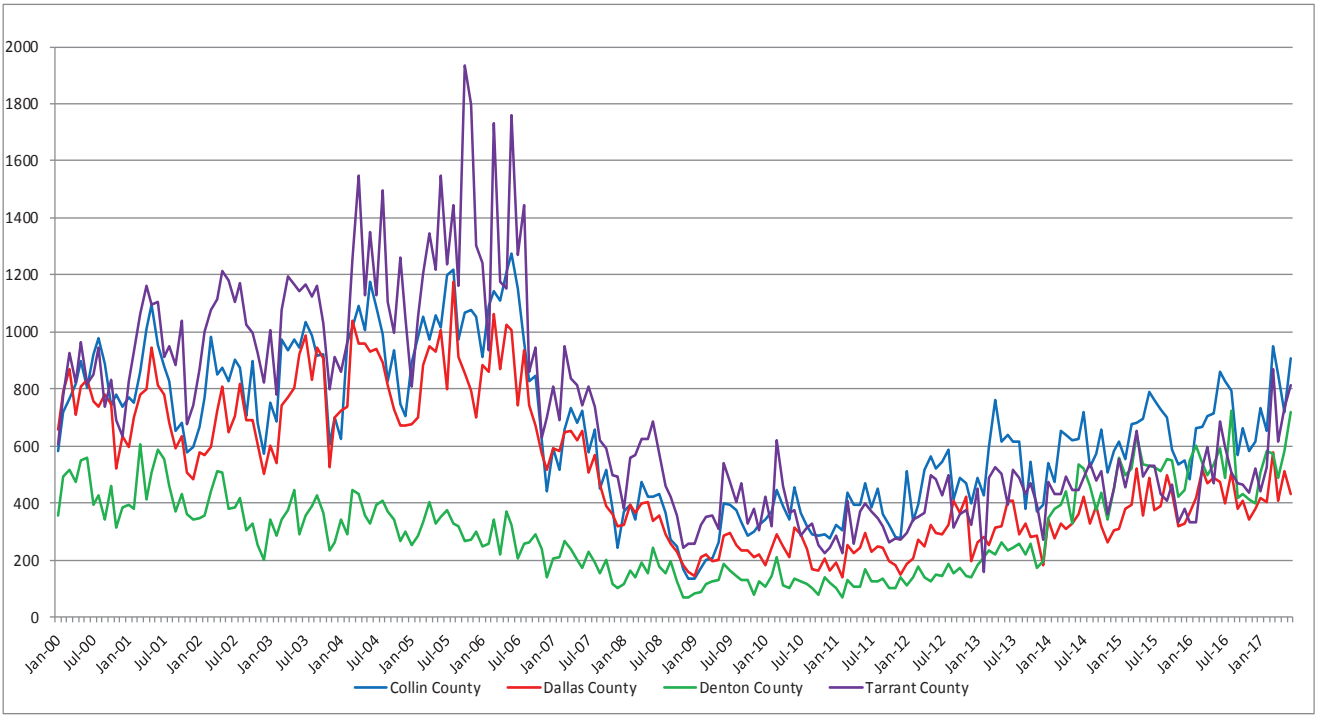
January 2000 to June 2017



Sources: Texas A&M Real Estate Center, 2017

As shown in Figure 10, the number of permitted multifamily units in Dallas, Tarrant, Collin, and Denton Counties has varied substantially between 2000 and 2016. The number of permitted units was higher during the region's downturn from 2001 to 2003. As the single-family housing market began to grow, apartment construction slowed during 2004 before increasing again in 2005 and continued through 2008. However, during 2009, the number of units permitted fell by roughly two-thirds to 5,256 units and the number of permits issued during 2010 was even lower. However, as the region's population has continued to grow strongly and single-family homes became difficult for some segments of the population to purchase, the number of permitted multifamily units has increased dramatically. 2012 through 2014 saw 16,000 or more permits issued for the four counties, while in 2015 a historic 27,689 permits were confirmed, over 16,000 of these in Dallas County alone. 2016 starts continued at a remarkable pace throughout the region. As of 1Q2017, over 50,000 multifamily units are under construction in DFW, making it the top apartment market in the US.

Table 12 shows the conditions of multifamily housing within the various submarkets in the Dallas-Fort Worth region during 3Q2016 and 2Q2017. According to the real estate research firm Berkadia, the region had an overall occupancy rate of 92.3 percent during 2Q2017, down from 93.4 percent three quarters prior. Rents have increased in every submarket except two, for an overall regional increase of 3.4 percent or $1031 to $1066 per unit. The data in Table 12 also show the highest occupancy rates for multifamily are in the Far South and Far East Dallas County submarkets and the highest effective monthly rent is in the Uptown submarket at $1,647.

Office Trends

Due to the influx of company headquarters to the region, the formation of new businesses and the growth of pre-existing ones, the office market in Dallas-Fort Worth continued to be strong with almost 11 million square feet under construction in 1Q17. According to the real estate firm Transwestern, the Dallas area office market had an overall vacancy rate of 15.6 percent during the first quarter of 2017, while the Fort Worth area office market had a vacancy rate of 14.1 percent (See Tables 13 and 14). Overall, the Dallas area market contained 252 million square feet of rentable space and the Fort Worth area market had 52 million square feet of rentable space. At the end of the first quarter of 2017, the net absorption (the difference between the amount of newly leased space in the market and new constructed space or formerly leased space that has returned to the market) in the Dallas area market was 1,176,963 square feet, which accounted for only a small portion of the 39.4 million square feet of vacant space. While the Fort Worth CBD showed net absorption at 31,565 square feet, this is attributable to new inventory coming on line and temporary factors. Geographically, the largest concentrations of office space in the Dallas-Fort Worth region are in the Dallas Central Business District, the Dallas North Tollway area, and the Upper Tollway/West Plano area, which has over 5.4 million square feet of office under construction. The highest vacancy rates during the first quarter of 2017 were found in the Northeast Fort Worth area (43.7 percent) and the Garland area (32.7percent). The Dallas CBD, with a vacancy rate of 22.2 percent, is improving, but is challenged by the popularity of uptown office properties.

Industrial/Warehousing Trends

As one of the primary distribution centers in the United States, the Dallas-Fort Worth region has an enormous amount of industrial/warehouse inventory totaling 747 million square feet as of the first quarter of 2017 (See Table 15). In the Dallas area market, there is 499.1 million square feet of rentable industrial space and 247.3 million square feet of rentable space in and around the Fort Worth area. In 1Q2017, a large number of deliveries to the region pushed the industrial/warehousing vacancy rate up slightly to 7 percent. Strong demand helped generate 4.3 million square feet in net absorption during 1Q17 and is a postive sign for the future market.

Retail Trends

Occupancy rates hit an all-time high in the Dallas-Fort Worth retail market reaching 94.6 percent during 2Q17. Strong big box absorption and retail demand caused the commercial retail market to absorb 1.56 million square feet during the quarter. The booming Far North Dallas submarket delivered 542,000 square feet in 2Q17 alone. Occupancy rates for retail were slightly higher in the Fort Worth area (94.9 percent) than in Dallas (94.4 percent). Asking rents have appeared to level off and many long-term leases will lock up retail space for considerable time likely causing new supply to be snapped up quickly.

Table 16: Overview of the Dallas-Fort Worth Retail Market during the Second Quarter 2017

RDS FORECAST REVIEW AND RESULTS

RDS was retained to review the latest socioeconomic forecasts for the NTTA System roadways for accuracy and reasonableness. For the purpose of this study, CDM provided RDS with households, population, and employment data from the demographic data that were used to develop Mobility 2040 at the TAP zone level. The data was provided by NCTCOG in four intervals, 2017, 2027, 2037 and 2040 for 4,039 TAP zones.

Passed in May 2015 by the Regional Transportation Council, the NCTCOG 2040 Demographic Forecast stands as the official demographic projection for the 2040 Metropolitan Plan. The projection process started with the establishment of regional household and employment control totals for the forecast years. The control totals were based on projections purchased from Dr. Ray Perryman, who has developed models for forecasting economic and demographic factors. The control totals were allocated to forecast districts using the Gravity Land Use Model (G-LUM). This specialized model was developed by Dr. Kara Kockelman at the University of Texas at Austin and further improved by NCTCOG staff in cooperation with UT Austin. The forecasts at the district level were then disaggregated to TAP zones using a disaggregation model developed at NCTCOG. TAP zone demographics were then sent to the respective cities for review and comment.

GIS Review: RDS relied heavily on geographic information system (GIS) technology during the comprehensive review process. RDS gathered multiple years of aerial photography, zoning and future land use maps, parcel boundaries and development databases for GIS analysis. Using GIS, RDS determined TAP zones where new development was likely to occur. RDS also acquired current housing data information from Metrostudy, one of the nation's leading new home research consultants. This data was also converted to a GIS dataset and mapped during the review process. Through the use of GIS, multiple datasets were displayed side-by-side. This allowed staff to review all model years of the NCTCOG Forecast simultaneously.

Households/Population: Original data from NCTCOG was provided to RDS by CDM Smith for the AOI for the years 2017, 2027, 2037 and 2040. After accounting for growth discrepancies between 2017 and 2027 in the original data, specific attention was given to areas that saw significant household growth. The housing data was plotted and future and vacant lot inventories were reviewed for inclusion. The development dataset also included residential projects and was mapped and reviewed with Metrostudy data (See Figure 11 for a sample map). Specific attention was also given to areas with the greatest potential of redevelopment. For example, the City of McKinney provided RDS a future land use shapefile that included their "Transit Village" designation. These villages are small geographic areas zoned for dense, multi-use development that is mass-transit and pedestrian friendly. Specific attention was given to areas like these, as well as future potential commuter rail stations or other land use or zoning areas that cities place focus on for future development.

Figure 11: Sample Development Monitoring Map

Employment: RDS staff reviewed the data with specific attention to zones that showed significant growth during the forecast years. The development database was very important, as many of the points of interest included building square footages and future projects. RDS also used consistent employees per square footage data (see Appendix C) for estimating job potential. The future year review used data and information gathered from the cities of McKinney, Plano, Frisco, Richardson, The Colony, Royse City, Dallas and DFW Airport and information from the development dataset that was labeled as under construction, future, or conceptual. Employment clusters around current and future rail stations, highway frontage, and CBD were also reviewed for potential growth or redevelopment.

Initial NCTCOG Data Adjustments: During preliminary analysis of NCTCOG's 2040 data, RDS discovered that 2,028 of the 4,038 TAP zones in the NTTA System roadway AOI showed decreases in households from 2017 to 2027 and similarly, 1,020 zones showed decreases in employment during the same timeframe. RDS reached out to NCTCOG's modeling team and was told that their 2017 data was derived using a different methodology than their 2027, 2037

and 2040 totals. The team explained that 2017 data are based on observed data and will be naturally jagged in small geographies while the later data assume a smooth transition from one year to another.

In order for RDS to derive baseline 2017 TAP zone household data that was, in most cases, less than NCTCOG's 2027 totals, RDS used 2010 Census data and NCTCOG's 2027 households to interpolate new 2017 household figures. Each TAP zone was then reviewed for accuracy.

Establishing 2017 zonal totals where NCTCOG's employment figures decreased between 2017 and 2027 was more problematic because of the lack of an independent "official" count, especially at a small geography. Therefore, RDS used previous data from recent projects where 2012 and 2018 iterations were established and interpolated 2017 totals from there. Longitudinal Employer-Household Dynamics (LEHD) TAP zone totals were used as a guide during review as well. As with households, all TAP zones in the NTTA roadway AOI were reviewed by RDS Staff for accuracy.

RDS 2017-2040 Review: Using GIS, Census data, new home reports, commercial development datasets and current year Appraisal District data for each individual TAP zone, iterations for 2017, 2027, 2037 and 2040 were reviewed for growth and reasonableness. RDS staff established their own totals for each. Household sizes were calculated using sizes established by the NCTCOG data to calculate population. Figures 12, 13, and 14 illustrate this growth from 2016 to 2040 and compare them by absolute and percentage growth as well as compound annual growth rate (CAGR) seen in RDS' and NCTCOG's forecasts.

Figure 12: RDS vs. NCTCOG Forecast Households (AOI only)

	17-40 CAGR	17-40 % Change
RDS Forecast	1.29%	34.2%
NCTCOG Forecast	1.38%	37.2%

Figure 13: RDS vs. NCTCOG Forecast Population (AOI only)

	17-40 CAGR	17-40 % Change
RDS Forecast	1.44%	39.1%
NCTCOG Forecast	1.51%	41..3%

Figure 14: RDS vs. NCTCOG Forecast Employment (AOI only)

	17-40 CAGR	17-40 % Change
RDS Forecast	1.56%	42.6%
NCTCOG Forecast	1.59%	43.8%

Table 17 illustrates NCTCOG's adopted and RDS' post-review AOI totals for households, population and employment for all forecast years.

Table 17: RDS and NCTCOG Area of Interest Statistics

	2017			2027		
	HH	POP	EMP	HH	POP	EMP
NTTA System (RDS)	2,080,277	5,731,170	3,795,299	2,423,375	6,732,256	4,512,938
NTTA System (NCTCOG)	2,064,212	5,725,541	3,959,547	2,347,974	6,572,192	4,572,799

	2037			2040		
	HH	POP	EMP	HH	POP	EMP
NTTA System (RDS)	2,703,996	7,679,350	5,192,143	2,792,003	7,970,976	5,413,394
NTTA System (NCTCOG)	2,720,288	7,739,958	5,433,846	2,831,961	8,090,241	5,692,159

For review of each model year's basic, service, and retail employment breakdowns, RDS used each iteration's shares provided by NCTCOG. RDS staff then reviewed these totals and adjusted the data over time using quantitative theory and professional judgment. Overall, RDS' recommended shares are very close to the shares proposed by NCTCOG, as shown in Table 18. Looking forward, the service sector is expected to gain in overall share of total employment, while the basic sector will see a slow decline. Retail sector change will remain relatively flat.

Table 18: NTTA System AOI Basic, Service and Retail Employment Shares NCTCOG and RDS (2017– 2040)

Percentage of Employment by Sector in AOI						
	RDS			NCTCOG		
Year	Basic	Retail	Service	Basic	Retail	Service
2017	24.4%	9.5%	66.1%	23.1%	9.4%	67.5%
2027	22.0%	10.1%	67.9%	21.3%	9.3%	69.4%
2037	20.7%	10.2%	69.1%	20.0%	9.1%	70.9%
2040	20.4%	10.2%	69.4%	19.7%	9.1%	71.2%

Figures 16 and 17 illustrate total household and employment growth by TAP zone in the NTTA System AOI from 2017 to 2040.

Figure 15: RDS Household Growth 2017-2040

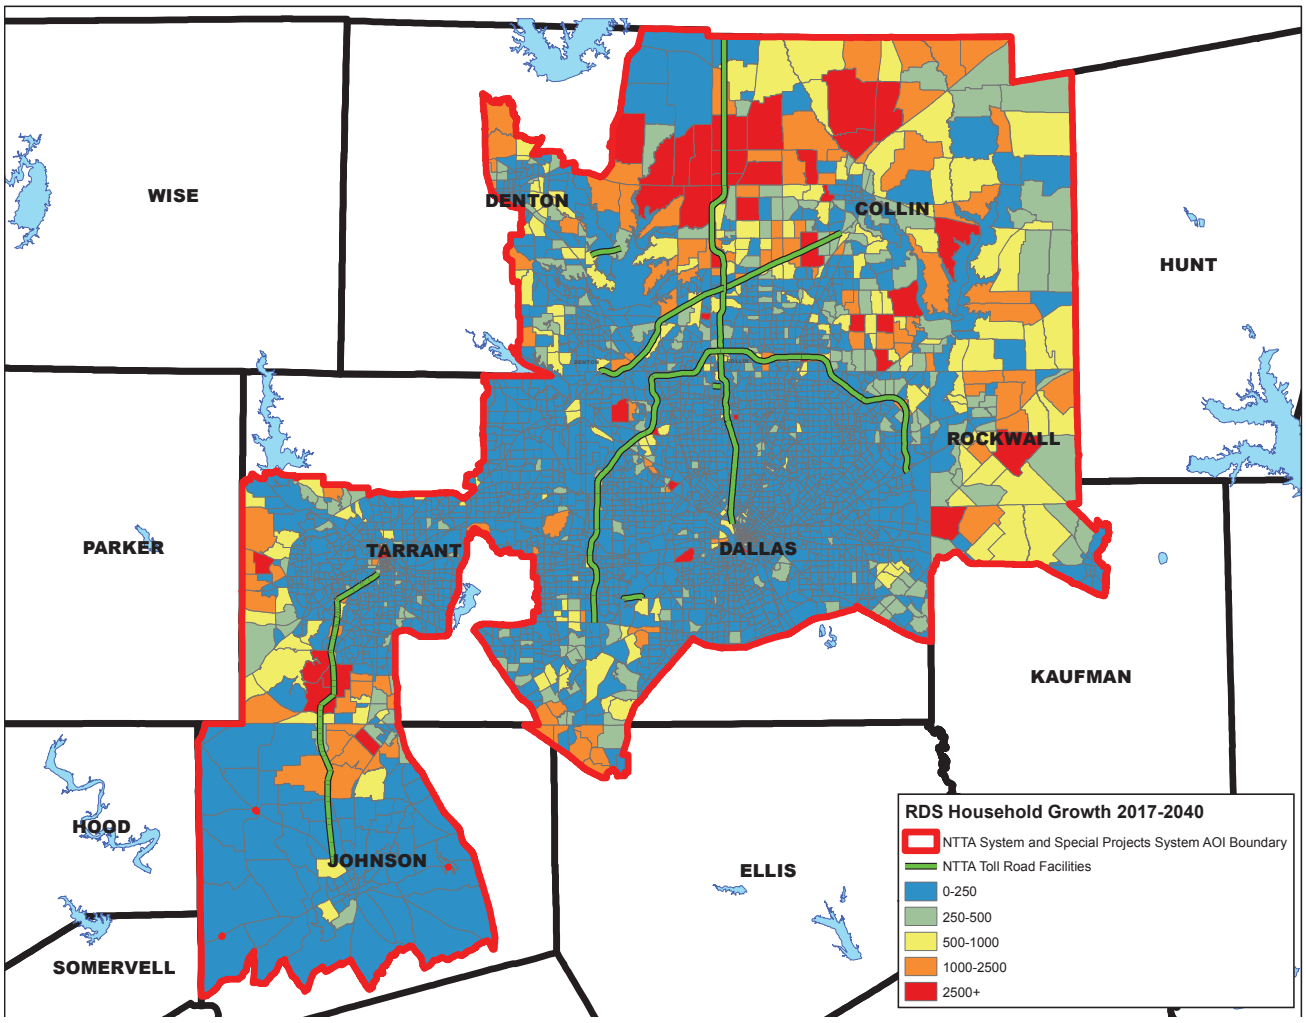

Figure 16: RDS Employment Growth 2017-2040

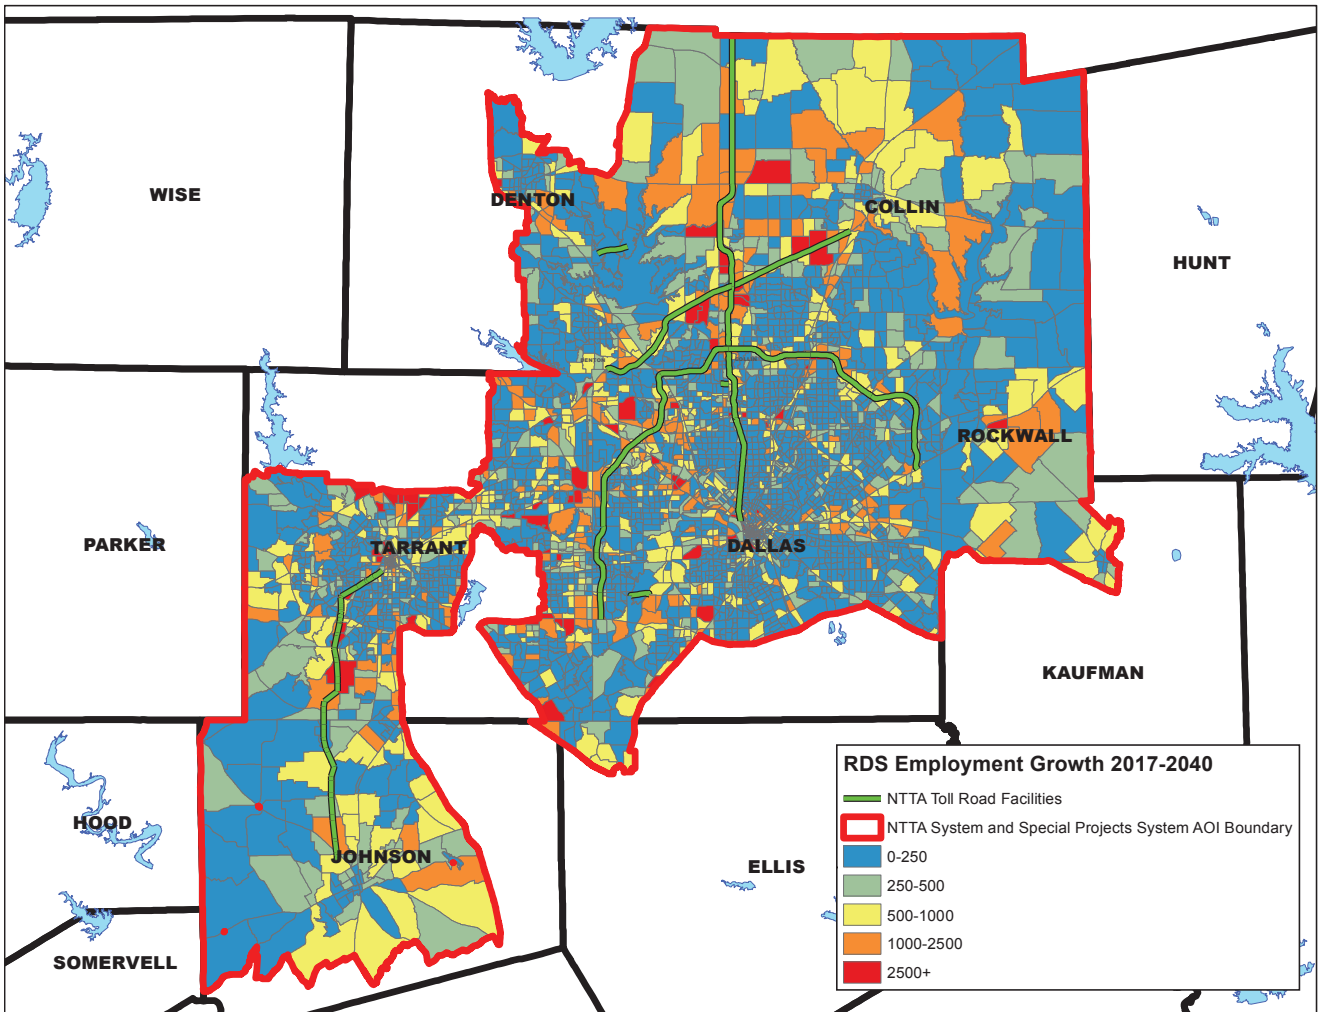

Special generators are employers with unique traffic patterns that generate high traffic volumes on a consistent or event-driven basis. Most of these special generators are universities, hospitals, and malls. NCTCOG examines each of these to ensure correct geographical location and then assigns each an accurate employment total. Here is a list of special generators located within the AOI. Each of these was taken into account when TAP zone totals were calculated to ensure proper traffic volumes.

Appendix C - Square Feet Per Employee Calculations

The following chart represents employee coefficients that were used as a guide when reviewing and estimating employment.

Land Use Category	Estimated Square Feet per Employee
Office	275
Retail	300
Hotel/Motel	.75 Emp per Room
Institutional	800
Industrial	1250

NTTA System Value of Time Update

This appendix contains the documentation of the value of time update as provided by the subconsultant, Resource Systems Group. This report was provided to CDM Smith in August 2016.

THIS PAGE INTENTIONALLY LEFT BLANK

MEMO

TO: Yagnesh Jarmarwala, CDM Smith

FROM: Mark Fowler, RSG

CC: Tristan Cherry, RSG

DATE: August 26, 2016

SUBJECT: NTTA System Wide Value of Time Update

In the first half of 2011, RSG conducted a stated preference (SP) survey for automobile drivers making trips within the Dallas–Fort Worth area. In the five years that have elapsed since that original data collection effort, it is possible the original estimates of VOT may need updating to reflect any socioeconomic changes in the region. In general, values of time in a particular corridor or area can be affected by several factors, including:

1. The types of trips being made (e.g., trip purposes, trip lengths),
2. The general travel conditions (e.g., congestion levels on existing roads)
3. The characteristics of the households making trips (e.g., household incomes) and
4. Economic conditions

While there may have been some changes in trip types and travel conditions in the corridor, they are likely to have been small and their effects are most likely to be mixed. The factors that are more likely to affect values of time over a five-year period are the characteristics of the households traveling in the corridor and the prevailing economic conditions in the region.

The behavioral models developed by RSG using the data collected in 2011 included an interaction with household income, as experience and research has shown that values of time increase as household incomes rise, though at a rate that is less than linear. If income levels have changed significantly in the region, it is likely that values of time have also changed.

In addition to the effect of household income on VOT, two economic effects can have an impact on values of time. First, inflation directly affects the net value of a given income level. Since the survey was conducted in 2011, both the values of time and the income levels are in 2011 $. Over the period from March of 2011, when the survey administration began, to November 2016 when the latest data is available, the consumer price index (CPI) has risen approximately 4.9% according to Bureau of

Labor Statistics data for the Dallas–Fort Worth area. All else equal, the nominal value of time should be increased by 4.9% to reflect current 2016 $. The table below shows bi-monthly CPI values for the Dallas–Fort Worth region, re-normalized to 1.0 for the month of March 2011. The table shows that over the past 5 years, CPI in the region has been variable, with overall inflation rising as high as 6.1% in 2014, but in general shows a steady and slow upward trajectory.

TABLE 1: DALLAS–FORT WORTH CPI GROWTH

	Jan	Mar	May	Jul	Sep	Nov
2011		1.000	1.009	1.008	1.011	1.011
2012	1.011	1.027	1.025	1.021	1.034	1.029
2013	1.033	1.046	1.042	1.048	1.049	1.041
2014	1.045	1.057	1.061	1.061	1.060	1.049
2015	1.038	1.051	1.056	1.057	1.051	1.049

The second potential economic effect that can influence travelers' willingness to pay is changes in discretionary spending. For example, consumers could change the amounts they spend independently of changes in income by trying to save money in anticipation of more difficult economic times. Consumer expenditures data are reported by the (BLS) at the regional level in calendar year intervals for overall expenditures and at and multiyear formats. The most recent data for overall expenditures is available at the MSA level for the Dallas–Fort Worth region. For the purposes of this analysis, the most recently published data for 2014 is compared against the total expenditures from the calendar year 2011. Between 2011 and 2014, average household spending in the region increased by 12.9%, significantly outpacing CPI inflation. Accounting for inflation, residents of the Dallas–Fort Worth region by the end of 2014 were spending more money in absolute terms than they were in 2011. Total spending on transportation items increased approximately 21% during this same period even while non-inflation adjusted spending on gasoline remained nearly equal. In other words, consumers in the region are spending less of their income on fuel in 2014 than they were in 2011. Instead, much of the spending growth in transportation costs can be attributed to 84% increase in the mean amount of dollars consumers in the Dallas–Fort Worth MSA spent on new vehicle purchases as the region recovered from the recession at the end of the last decade.

Incomes in the region have also changed since the first quarter of 2011. According to quarterly wage data from the BLS, between the first quarter of 2011, when the survey was conducted, and the first quarter of 2015, the latest equivalent quarter for which wage data is available, average weekly wages in the Dallas–Fort Worth area grew by approximately 12.9%, more than inflation over the same period of 3.6%. This overall wage increase means there is a significant growth in real inflation-adjusted income in the Dallas–Fort Worth region.

TABLE 2: DALLAS–FORT WORTH AVERAGE WEEKLY WAGES

Year	Q1	Q2	Q3	Q4
2011	$1,013	$967	$1,002	$1,033
2012	$1,080	$977	$991	$1,087
2013	$1,072	$992	$1,001	$1,072
2014	$1,123	$1,018	$1,030	$1,111
2015	$1,144	$1,044	$1,049	$1,164

CONCLUSIONS

Based on our review of the available data, we believe the values of time that we estimated for potential travelers on tolled NTTA facilities should be adjusted to reflect the changes in the CPI from 2011$ to 2016$. In addition, income growth has outpaced inflation over this same time period, resulting in a growth in real incomes of about 9.3%. As a result, VOT has more than likely exceeded the CPI increased in the region and VOTs should be adjusted to match. The income elasticity estimated as part of the discrete choice models can be used to calculate the impact that this growth in real income has on VOT. At the sample median income of $87,500, an 9.3% growth in real income results in a growth in VOT of approximately 0.98%. Our recommendation is therefore to adjust the values of time by 1.0098 to reflect changes in real income and 1.049 to bring the values up to 2016$, for a total adjustment factor of 1.059.
